CAPACITY STRENGTHENING TOOLKIT

International Hepatitis C in Primary Care and Drug and Alcohol Settings Education Program

Supporting increased hepatitis C screening, linkage-to-care and treatment among people who inject drugs in Nigeria

INHSU

Contents

About

This toolkit is provided to participants of the INHSU Hepatitis C in Primary Care and Drug and Alcohol Settings Education Program. The toolkit is intended to provide participants with practical tools with which to implement HCV testing, linkage to care and treatment processes in their setting.

The toolkit is tailored in line with local guidelines and referral pathways for each workshop location.

Although some resources will be applicable only for participants working within the local area of workshop delivery, many, such as DAA treatment regimen quick reference guides, management procedure templates and assessment checklists, will be relevant regardless of practice location.

Resources applicable across all locations within South Africa are available as an enduring education program component as free downloads via the INHSU website: https://www.inhsu.org/what-we-do/education/nigeria

Acknowledgements

This program has been developed in collaboration with:

- The Kirby Institute, UNSW Sydney
- Australasian Society for HIV, Viral Hepatitis and Sexual Health Medicine (ASHM)
- South African HIV Clinicians Society (SAHCS)

The materials were reviewed for Nigeria by:

- Dr Roger Abang, Medical Doctor and Director of Programs, Heartland Alliance Nigeria
- Edem Ekpenyong, State Coordinator of Nigerian Network of People Who Use Drugs and Executive Director of Health Action Support Initiative

Africa Steering Committee:

- Dr Roger Abang, Medical Doctor and Director of Programs, Heartland Alliance Nigeria
- Mr Chukwuemeka Agwuocha, Program Manager, Hepatitis/COVID-19 Therapeutics, Clinton HealthAccess Initiative
- Dr Jebet Boit, National AIDS and STIs Control Programme, Ministry of Health, Government of Kenya
- Ms Faoizia Bouzzitoun, Executive Director, AHSUD – HASNOUNA
- Monica Ciupagea, Expert in Drug Use and HIV, United Nations Office on Drugs and Crime
- Dr Ahmed Cordie, Lecturer of Endemic Medicine and Coordinator of HIV and Viral Hepatitis FightingGroup, Cairo University Hospitals
- Mr Edem Ekpenyong, State Coordinator of Nigerian Network of People Who Use Drugs and ExecutiveDirector of Health Action Support Initiative
- Professor Dr Gamal Esmat, Professor of Hepatology and Endemic Medicine and Vice-President of Cairo University for Graduate Studies and Research
- Mr Kingsley Essomeonu, Assistant Director, Community Prevention and Social & Behavioural Change Communication, Nigeria Agency for the Control of AIDS
- Professor Hossam Abdel Ghaffar, General Secretary of the Supreme Council of University Hospitals and Official Spokesperson for the Egyptian Ministry of Health
- Dr Mehdi Karkouri, Professor of Medicine at the Faculty of Medicine of Casablanca and President ofthe Association de Lutte Contre le Sida
- Mr Koketso Mokubane, Community Linkage Officer, South African Network of People Who Use Drugs
- Ms Mercy Nyakowa, National AIDS and STIs Control Programme, Ministry of Health, Government of Kenya
- Ms Ester Tata Papa, National AIDS and STIs Control Programme, Ministry of Health, Government of Kenya
- Dr Tariq Sonnan, Regional Programme Coordinator HIV/AIDS Prevention and Care, UNODC Regional Office for the Middle East and North Africa
- Dr Andrew Scheibe, Medical Doctor and Technical Advisor, TB HIV Care
- Professor Wendy Spearman, Hepatologist and Head of the Division of Hepatology, Department of Medicine, Faculty of Health Sciences at the University of Cape Town
- Professor Mark Sonderup, Hepatologist, Groote Schuur Hospital and University of Cape Town

- Dr Kgomotso Vilakazi-Nhlapo, Viral Hepatitis Lead, South African National Department of Health
- Jessica Zalami, MENANPUD

INHSU HCV in Primary Care and Drug and Alcohol Settings

Glossary

Term	Definition
APRI	AST-to-Platelet Ratio Index
Ascites	The accumulation of fluid (usually serous fluid which is a pale yellow and clear fluid) that accumulates in the abdominal cavity
Asymptomatic	Of a condition or a person producing or showing no symptoms
Cessation	The fact or process of ending or being brought to an end
Cerebral infarction	An area of necrotic tissue in the brain resulting from a blockage or narrowing in arteries supplying blood and oxygen to the brain
Cirrhosis	A complication of liver disease which involves loss of liver cells and irreversible scarring of the liver
Enzyme	Macromolecular biological catalysts. They accelerate chemical enzymes
Ethinylestradiol	An orally active estrogen and a synthetic derivative of estradiol, a steroid hormone and the major endogenous estrogen in humans
Etiology	The cause, set of causes, or manner of causation of a disease or condition
Fibrosis	The formation of excess fibrous connective tissue in an organ or tissue in a reparative or reactive process. This can be reactive, benign, or pathological state. In response to injury, this is called scarring, and if it arises from a single cell line this is called a fibroma.
Genotype	The genetic constitution of an individual organism
Hepatocellular carcinoma (HCC)	The most common type of primary liver cancer. It occurs predominantly in patients with underlying chronic liver disease and cirrhosis.
Jaundice	A medical condition with yellowing of the skin or whites of the eyes, arising from excess of the pigment bilirubin and typically caused by obstruction of the bile duct, by liver disease, or by excessive breakdown of red blood cells
Lethargy	A lack of energy
Myalgia	Pain in a muscle or group of muscles
Opioid	An opium-like compound that binds to one or more of the three opioid receptors of the body
Opioid agonist treatment	An effective treatment for addiction to opioid drugs such as heroin and involves taking the opioid agonists methadone or buprenorphine (suboxone)
Palmar erythema	Reddening of the palms
PCR	Polymerase Chain Reaction
Peripheral edema	An accumulation of fluid causing swelling in tissues perfused by the peripheral vascular system, usually in the lower limbs

Portal hypertension	An increase in the blood pressure within a system of veins called the portal venous system
RNA	Ribonucleic acid
Serology	The scientific study or diagnostic examination of blood serum, especially with regard to the response of the immune system to pathogens or introduced substances
Spider nevi	A collection of small, dilated blood vessels that are clustered close to the skin's surface
Thrombocytopenia	A condition in which you have a low blood platelet count
Viremic	A medical condition where viruses enter the blood stream and hence have access to the rest of the body

DECISION MAKING IN HEPATITIS C

HCV

1 When To Test

Clinical Indicators

- Abnormal liver function tests (LFTs) (males, AST ≥ 40 U/L; females, AST ≥ 32 U/L)
- Jaundice and unexplained pruritus

Presence of Risk Factors

- Injecting drug use (current/ever)
- Sharing of drug use equipment
- Born between 1959 - 1978
- Born in high prevalence region^
- Transfusion of unscreened blood, blood products and post organ transplant
- Unsterile tattooing/body piercing
- Unsterile medical/dental procedures
- Time in prison
- Needlestick injury
- Mother to child transmission
- Sexual transmission in men who have sex with men (MSM)
- Sexual transmission in those who are HIV positive
- Sexual transmission in commercial sex workers
- Receiving hemodialysis
- Healthcare workers
- Hepatitis B surface antigen positive
- Presence of STIs

Other

- Initiating PrEP
- When someone requests a test
- Preparation for surgery

When gaining informed consent discuss:

- Reason for test
- What a positive antibody result means
- Next steps if antibody positive
- Availability of curative treatment
- Prevention of HCV if antibody is negative

2 Test/s, Results and Actions

Order HCV Antibody (Ab)*

HCV Ab negative

HCV Ab positive

HCV RNA (qualitative) **+ LFTs**

HCV RNA negative

HCV RNA positive

Does NOT have HCV

Has CLEARED HCV

Has CURRENT HCV

NO action
However, if possible recent infection re-test (HCV Ab), or if ongoing risk factors repeat screening (HCV Ab) annually

RE-TEST if:
Ongoing risk factors
(repeat RNA test annually)

Further ASSESSMENT and TREATMENT
(see next page)

When conveying a NEGATIVE result, discuss:

- Modes of transmission
- Strategies for reducing risk

When conveying a POSITIVE result, discuss:

- Availability of curative treatment
- Modes of transmission and risk reduction
- Lifestyle factors e.g. alcohol minimization, diet
- Availability of peer support, information and any other support services

^Africa, the Middle East (in particular Egypt), the Mediterranean, Eastern Europe, and South Asia

***If high level suspicion also consider requesting reflexive HCV RNA + LFTs**

 ISBN:978-1-921850-73-8

DECISION MAKING IN HEPATITIS C

HCV

3 Pre-Treatment Assessment

Baseline screening after positive HCV PCR

- ☐ Complete Blood Count (CBC)
- ☐ Urea, electrolytes, creatinine
- ☐ AST, ALT, GGT, ALP, Tbil, Dbil, INR, Alb
- ☐ Pregnancy test (in women of childbearing age)
- ☐ Qualitative or quantitative HCV RNA if available
- ☐ HCV genotyping

Assess liver fibrosis: cirrhotic status

- ☐ Signs of chronic liver disease (spider naevi, palmar erythema, jaundice, encephalopathy, hepatomegaly, splenomegaly, ascites, peripheral oedema)
- ☐ Non-invasive assessment of fibrosis:
  - Serum biomarkers such as APRI (<1.0 means cirrhosis unlikely). Calculator available. hepatitisc.uw.edu/page/clinical-calculators/apri
  - Elastography assessment e.g. FibroScan® (>12.5 kPa consistent with cirrhosis)
  - Ultrasound assessment

Check for other causes of liver disease/coinfections

- ☐ HIV Ab
- ☐ Hepatitis A – check hep A IgG; vaccinate if negative
- ☐ Hepatitis B – check HBsAg, anti-HBc and anti-HBs; vaccinate if all negative
- ☐ Heavy alcohol intake
- ☐ Fatty liver disease - check weight, BMI

Check for other major co-morbidities

- ☐ Renal impairment (eGFR < 50)
- ☐ Thyroid function test
- ☐ Screening for other autoimmune disorders

Review previous HCV treatment

- Choice/length of treatment may be influenced by prior HCV treatment experience/response

Consider pregnancy and contraception

- HCV treatment not recommended for use in pregnant or lactating women
- Active monitoring during pregnancy and breastfeeding

4 Treatment

Is your patient likely to have cirrhosis?
(APRI > 2 or FibroScan® > 12.5)

☐ Yes → Consider discussion with, or referral to experienced HCV treater

☐ No

Has your patient received previous treatment for HCV?

☐ Yes → Consider discussion with, or referral to experienced HCV treater

☐ No → Click HERE to view treatment recommendations for Nigeria

Treatment	Dosage	Duration if no cirrhosis present
SOF/DAC	400/60 mg Once-daily (1 pill, +/- food)	12 weeks
SOF/LED	400/90 mg Once-daily (1 pill, +/- food)	12 weeks
SOF/RIB	400/200 mg SOF Once-daily RIB Twice-daily*	12/24 weeks

☐ Check for drug-drug interactions at hep-druginteractions.org

SOF/DAC = Sofosbuvir/Daclatasvir (all genotypes)
SOF/LED = Sofosbuvir/Ledipasvir (genotypes1, 4, 5, 6)
SOF/RIB = Sofosbuvir/Ribavirin (genotype 2 for 12 weeks and genotype 3 for 24 weeks)
*RIB + food: <75kg 1000mg/day (400mg/2 capsules in the morning and 600mg/3 capsules in the evening) >75kg 1200mg/day (600mg/3 capsules in the morning and 600mg/3 capsules in the evening).

5 Monitoring

Monitoring while on treatment

- Generally not required, but approach should be individualized
- Side effects of HCV treatment are generally minimal
- Consider monitoring adherence

12 weeks post treatment

- ☐ HCV RNA to confirm cure (sustained virological response SVR12 = cure)
- ☐ Liver enzymes

6 Follow Up

If your patient has:

No cirrhosis and normal liver enzyme results (males, ALT< 45 U/L; females, ALT <34 U/L)
No clinical follow-up for HCV required

Ongoing risk factors
Annual HCV RNA test. If re-infected offer re-treatment. Offer education on harm reduction strategies

Abnormal liver enzyme results
(males, ALT ≥ 30 U/L; females, ALT ≥ 19 U/L) Evaluate for other causes of liver disease and refer to specialist for review

Cirrhosis
Refer to specialist. Patients with cirrhosis require long-term monitoring:

- 6-monthly abdominal ultrasound (hepatocellular carcinoma screening)
- Consideration of screening for esophageal varices

CONSULT WITH A SPECIALIST IF:

Pre-treatment

- Cirrhosis is present or likely – APRI ≥2 and elastography score not available; elastography >12.5kPa
- Coinfected with HIV or HBV
- Renal impairment (eGFR < 50)
- Prior treatment failure of HCV treatment
- Complex drug interactions
- Complex co-morbidities
- Not comfortable prescribing HCV treatment

During treatment

- Major medication side effects

Post treatment

- RNA positive 12 weeks post treatment
- Abnormal liver enzymes at SVR12

NATIONAL GUIDELINES FOR THE PREVENTION, CARE AND TREATMENT OF VIRAL HEPATITIS B & C IN NIGERIA

NATIONAL AIDS/STIS CONTROL PROGRAM
FEDERAL MINISTRY OF HEALTH

2016

NATIONAL GUIDELINES FOR THE PREVENTION, TREATMENT AND CARE OF VIRAL HEPATITIS IN NIGERIA

NATIONAL AIDS/STIS CONTROL PROGRAMME, FEDERAL MINISTRY OF HEALTH

2016

ISBN:

Federal Ministry of Health, Abuja, Nigeria

FOREWORD

Nigeria contributes significantly to the burden of chronic viral hepatitis infection globally with prevalence of 11% and 2.2% for viral hepatitis B and C respectively. This corresponds to above 20 million people living with viral hepatitis B and/or C in a population of 177 million individuals who are not aware and are at the risk of developing chronic complications of liver cirrhosis and primary liver cell cancers. Most worrisome is the risk of transmitting the infection to other unsuspecting members in the communities.

The National Guidelines for the Prevention, Treatment and Care of Viral Hepatitis in Nigeria has been developed with the guiding principle of achieving Universal coverage through accessible, affordable, available health services based on human rights and equity. Other considerations include government ownership, effective partnership and the use of public health approach for effective and efficient programme implementation.

This document provides strategies towards achieving the global target of eliminating viral hepatitis by 2030 as endorsed by the United Nations member States at the 59th World Health Assembly of 2016 which include protecting against mother to child transmission of viral hepatitis, reaching every child, adolescents, adults and high risk population groups with viral hepatitis B vaccination, ensuring safety of blood transfusion services, organ donation and injection practices and the use of new antiviral drugs for the treatment and cure viral hepatitis B and C respectively.

It is expected that strict adherence to the guidelines will provide the required platform for the attainment of the goal of reducing mortality, morbidity and socio-economic impact of viral hepatitis in Nigeria.

Professor Isaac Folorunso Adewole FAS, FSPSP, DSc (Hons)
Honourable Minister of Health,
Federal Republic of Nigeria

PREFACE

This is the first edition of the National Guidelines for Prevention, Treatment and Care of Viral Hepatitis in Nigeria. It is in response to the World Health Assembly resolution for member nations to take action in the prevention, diagnosis and treatment of viral hepatitis that the Federal Government of Nigeria embarked on this noble project to combat the spread of Viral Hepatitis which has been described as a silent epidemic.

The development of this document spanned rigorous processes. It involved various stakeholders including the Academia, Development Partners, Programme managers, Civil Society Organizations, representatives from the states of the federation, pharmaceutical companies, Funders and the United Nations organizations.

The guidelines have been developed with the guiding principle of achieving Universal coverage through accessibility, affordability, availability and human rights and equity. Other considerations include government ownership, effective partnership and the use of public health approach for effective and efficient programme implementation.

The guidelines provide a framework for health care service delivery in the Prevention, Care and treatment of Viral Hepatitis in Nigeria in line with the global aspiration of eliminating viral hepatitis by 2030 as endorsed by the United Nations member States at the 59th World Health Assembly of 2016.

This document is recommended for use by all stakeholders including policy makers at all levels of government, healthcare workers, civil society organizations, local and international partners.

Dr. (Mrs) Amina M. B. Shamaki mni
Permanent Secretary, Federal Ministry of Health, Nigeria

ACKNOWLEDGEMENT

I would like to express our sincere gratitude to the members of the National Technical Working Group for the Control of Viral Hepatitis in Nigeria including representatives from the Society for Gastroenterologists and Hepatologists of Nigeria (SOGHIN), Association of Public Health Physicians of Nigeria (APHPN), the Academia, WHO, Clinton Health Access Initiative (CHAI), Canters for Disease Control and Prevention (CDC), Pharmaceutical Companies, Implementing Partners, Civil Society Organizations, Line Ministries, Departments and Agencies for their tireless efforts in the development of this document.

We appreciate Roche Pharmaceuticals Ltd, Clinton Health Access Initiative (CHAI), World Health Organization, Philips Pharmaceuticals and Mylan Pharmaceuticals for the financial support in the development of this document.

We thank our colleagues from the other departments of the Federal Ministry of Health including the National Blood Transmission Centre, Epidemiology Division, National Agency for Food and Drug Administration and Control, National Primary Health Development Agency, National Cancer Control Programme and the Non- Communicable Disease Division of the Department of Public Health.

We thank the staff of the National AIDS and STIs Control Programme (NASCP) for effectively coordinating the development of this document and providing the secretariat for the Viral Hepatitis Control Programme in Nigeria.

Dr. Evelyn Ngige
Director Public Health
Federal Ministry of Health, Nigeria

EXECUTIVE SUMMARY

Viral hepatitis is inflammation of the liver caused by one or more of five main hepatic viruses: A, B, C, D and E. Although, these viruses display similar symptoms and the potential to cause liver disease to varying degrees; they however differ significantly in regards to epidemiology, prevention, diagnosis, and care and treatment. Viral hepatitis is a major global health problem with more than 400 million patients chronically infected, causing over 1.4 million deaths per year. Nigeria is among the countries with a high burden of viral hepatitis with a Hepatitis B Virus (HBV) and Hepatitis C Virus (HCV) prevalence of 11% and 2.2%, respectively (FMOH 2013).

Knowledge of viral hepatitis remains low among Nigerians despite being a leading infectious cause of death each year. As a consequence, most of the estimated 20 million Nigerians living with viral hepatitis B or C are undiagnosed, increasing the likelihood of future transmission to others and placing them at greater risk for severe, even fatal health complications such as liver cirrhosis and liver cancer (hepatocellular carcinoma).

Some key subpopulations, such as men who have sex with men (MSM) and people who inject drugs (PWID) have a high risk of viral hepatitis infection. Persons living with HIV are also disproportionately affected by viral hepatitis and related adverse health conditions, considering that HIV, HBV, and HCV share common modes of transmission.[3] The progression of viral hepatitis is accelerated among persons with HIV; therefore, HIV co-infected persons experience greater liver-related health problems than non-HIV infected persons. Recipients of organs, blood, and tissue, along with persons working or receiving care in health settings continue to be at risk for viral hepatitis infection as well.

Nigeria is among countries with the highest burden of viral hepatitis with the prevalence of HBV and HCV at 11% and 2.2%, respectively. The distribution of HBV by sex is 62.6% of males and 37.4% of females, while the distribution of HCV by sex is 52.4% to 47.6%. Infections are most common among 21-40 year olds, although substantial perinatal and childhood transmissions do occur. Medical personnel, especially surgeons and dentists are at the greatest risk of infection, while other healthcare workers, commercial sex workers, and drivers are also at significant risk of infection. In Nigeria, HBV transmission results in substantial morbidity and mortality from chronic HBV, liver cirrhosis, and hepatocellular carcinoma. Risk factors for transmission in Nigeria include sexual intercourse, local circumcision, local uvelectomy, scarification, tribal marks, surgical procedures, body piercing, home birth, and ~~receipt of~~ blood transfusions

These are the first edition of the Federal Ministry of Health guidelines for the prevention, care and treatment of viral hepatitis especially B and C in Nigeria. These guidelines have been developed for use by policy makers, programme managers, and health-care providers at all levels of care in Nigeria.

The development of this document is aligned with the global principle of eliminating viral hepatitis by 2030 which is in keeping with the United Nations adoption during the 59th World Health Assembly in May 2016. The strategies and recommendations have been adopted based on the principle of achieving universal health coverage including accessibility, availability, affordability

and human rights and equity. Other considerations include government ownership, effective partnership and the use of public health approach.

The recommendations are structured along the continuum of care for persons with chronic viral hepatitis B and C from initial assessment of stage of disease and eligibility for treatment, to initiation of first-line antiviral therapy and monitoring for disease progression, toxicity and hepatocellular cell carcinoma and switch to second-line drugs in persons with treatment failure especially in viral hepatitis B and for viral hepatitis C using antiviral drugs. They are intended for use across age groups and adult populations.

These guidelines are covered in seven (7) chapters. Chapter 2 dealt with the management of viral hepatitis B including prevention of perinatal and early childhood HBV infection through infant hepatitis B vaccination; catch-up vaccination and other prevention strategies in key affected populations such as persons who inject drugs, men who have sex with men, and sex workers; as well as prevention of HBV transmission in health-care settings. The use of alcohol reduction interventions to reduce progression of liver disease in those with CHB was also highlighted. It also recommended the use of simple, non-invasive diagnostic tests to assess the stage of liver disease and eligibility for treatment; prioritize treatment for those with most advanced liver disease and at greatest risk of mortality; and recommend the preferred use of nucleos(t)ide analogues with a high barrier to drug resistance (tenofovir and entecavir, and entecavir in children aged 2–11 years) for first- and second-line treatment. These guidelines also recommend lifelong treatment in those with cirrhosis; and regular monitoring for disease progression, toxicity of drugs and early detection of Hepatocellular cancer. An additional chapter highlights management considerations for specific populations, including those co-infected with HIV, HCV and hepatitis D virus (HDV); children and adolescents; and pregnant women.

.Chapter 3 dwelt on the management of viral hepatitis C, The majority (80%) of HCV infections progresses to Chronic Liver Disease (CLD). Outcomes vary widely from subclinical infection to end stage liver diseases (ESLD, 20%) and liver cancer (5%). It provides the guidelines for screening, treatment and care persons with chronic hepatitis c virus (HCV) infection. The Direct Acting Antiviral Drugs and interferon based regimen are the drugs of choice in the treatment of viral hepatitis C. The treatment regimens and duration depend majorly on the presence of liver cirrhosis in the patient, the viral genotype

Chapter 7 recommended strategies for effective programme management of viral hepatitis including health system strengthening, decentralization of services, task shifting, logistics management, monitoring and evaluation and operational research for the control of viral hepatitis in Nigeria.

ACRONYMS/ABBREVIATIONS

ADR: Adverse drug reaction
AEs: Adverse events
AEFI: adverse events following immunization
AHB: Acute hepatitis B
ALP: Alkaline Phosphatase
ALT: Alanine Transaminase

TABLE OF CONTENT

CHAPTER ONE

INTRODUCTION

1.0 OVERVIEW

Viral hepatitis is inflammation of the liver caused by one or more of five main hepatic viruses: A, B, C, D and E. Although, these viruses display similar symptoms and the potential to cause liver disease to varying degrees; they however differ significantly in regards to epidemiology, prevention, diagnosis, and care and treatment. Viral hepatitis is a major global health problem with more than 400 million patients chronically infected, causing over 1.4 million deaths per year.[1] Nigeria is among the countries with a high burden of viral hepatitis with a Hepatitis B Virus (HBV) and Hepatitis C Virus (HCV) prevalence of 11% and 2.2%, respectively (FMOH 2013).

Knowledge of viral hepatitis remains low among Nigerians despite being a leading infectious cause of death each year. As a consequence, most of the estimated 20-24 million Nigerians living with viral hepatitis B or C are undiagnosed, increasing the likelihood of future transmission to others and placing them at greater risk for severe, even fatal health complications such as liver cirrhosis and liver cancer (hepatocellular carcinoma).

Some key subpopulations, such as men who have sex with men (MSM) and people who inject drugs (PWID) have a high risk of viral hepatitis infection. Persons living with HIV are also disproportionately affected by viral hepatitis and related adverse health conditions, considering that HIV, HBV, and HCV share common modes of transmission.[3] The progression of viral hepatitis is accelerated among persons with HIV; therefore, HIV co-infected persons experience greater liver-related health problems than non-HIV infected persons. Recipients of organs, blood, and tissue, along with persons working or receiving care in health settings continue to be at risk for viral hepatitis infection as well.

1.1 GLOBAL PERSPECTIVES

Current rates of viral hepatitis infection in Nigeria are reflective of the global disease burden involving hundreds of millions of persons. One in every 12 persons worldwide is living with viral hepatitis; approximately 240 million persons are infected with chronic HBV and another 80 million are infected with chronic HCV infection.[1] Globally, an estimated 7% of primary liver cancer and 54% of liver cirrhosis cases are caused by viral hepatitis, and approximately 1.4 million deaths from viral hepatitis occur each year.

The proportion of persons living with viral hepatitis is greatest in Asia, sub-Saharan Africa, and Egypt. Nigeria accounts for 8.3% and 4.5% of the global burden of chronic HBV and HCV respectively. The prevalence of HCV infection is particularly high among subpopulations (e.g. people who inject drugs (PWID) and persons living in correctional settings) in many parts of the world.

1.2 EPIDEMIOLOGY

1.2.1 Epidemiology of Viral Hepatitis in Nigeria

Nigeria is among countries with the highest burden of viral hepatitis with the prevalence of HBV and HCV at 11% and 2.2%, respectively. The distribution of HBV by sex is 62.6% of males and 37.4% of females, while the distribution of HCV by sex is 52.4% to 47.6%. Infections are most common among 21-40 year olds, although substantial perinatal and childhood transmissions do occur. Medical personnel, especially surgeons and dentists are at the greatest risk of infection, while other healthcare workers, commercial sex workers, and drivers are also at significant risk of infection. In Nigeria, HBV transmission results in substantial morbidity and mortality from chronic HBV, liver cirrhosis, and hepatocellular carcinoma. Risk factors for transmission specific to Nigeria include local circumcision, local uvelectomy, scarification, tribal marks, surgical procedures, body piercing, home birth, and receipt of blood transfusions.

1.2.2 Viral Hepatitis subtypes

Viral Hepatitis has five major types- A, B, C, D and E, with varying degrees of epidemiology, prevention, diagnosis and treatment.

Hepatitis A Virus (HAV), which is primarily spread via faecal-oral transmission, causes Hepatitis A infection; when an uninfected, unvaccinated person ingests food or water that is contaminated with the faeces of an infected person. The disease is closely associated with unsafe water, inadequate sanitation, and poor personal hygiene. Symptomatic progression is rare with mostly mild cases characterized by full recovery and lasting immunity from further HAV infections. However, a few cases can be severe and life threatening. Safe and effective vaccines are available to prevent HAV infection.

Children are likely to have experienced an episode of hepatitis A virus infection before the age of 10. Those infected in childhood do not experience noticeable symptoms. Epidemics are uncommon due to herd immunity from prior infection. HAV may lead to significant economic and social consequences due to delayed recovery lasting weeks to months; preventing the expedited return to work, school or daily life. The impact on food establishments, with identified HAV as a source of transmission in outbreaks, can be substantial.

HAV rarely causes death. Unlike HBV and HCV, HAV does not cause chronic liver disease and is rarely fatal; however, the infection may cause debilitating symptoms and fulminant hepatitis (acute liver failure), resulting in substantial mortality. Persons with pre-existing chronic liver disease, including chronic HBV and HCV, are at increased risk of serious complications from HAV infection.

Hepatitis B infection is a vaccine-preventable disease transmitted through infected blood, semen, and other body fluids. HBV is 50-100 times more infectious than HIV with several modes of transmission; such as perinatal transmission from infected mother to child, unsafe sexual intercourse, transfusion of HBV-infected blood and blood products, unsafe medical procedures, sharing of needles and sharps and horizontally between children, as well as other intra-familial sources of infection. Globally, it is estimated that 2 billion people have been infected with HBV of which approximately 240 million are chronically infected with HBV. Among those with chronic HBV, up to 30% go on to develop liver disease. The average prevalence rate for HBV in Nigeria

ranges between 11- 13.7% with an estimated 20 million Nigerians chronically infected.[iii] There is no known virologic cure for HBV infection, however antiviral treatment has been shown to reduce the transmission risk, decrease the likelihood of developing liver complications resulting in death and improve prognosis.

Hepatitis C infection is a blood borne virus 10 times more infectious than HIV with no currently available vaccine. The most common modes of transmission are through HCV-infected blood, unsafe medical procedures, and sharing of needles and sharps. Less common modes of transmission are sexual and perinatal transmission. Globally, an estimated 80 million patients are chronically infected resulting in roughly 700 thousand deaths per year.[i] An estimated 3.6 million patients are infected with HCV in Nigeria; however, the epidemiology of HCV in Nigeria is not well defined due to paucity of data. With current HCV direct acting antiviral (DAAs) agents, higher rates of sustained virologic response (SVR) have been recorded globally.

Hepatitis D infection occurs exclusively in persons infected with HBV; replication occurs solely in the presence of HBV. Co-infection with HDV and HBV can result in significant morbidity and mortality. HBV vaccination is protective against both HBV and HDV infections in HBsAg negative individuals.

Hepatitis E infection is transmitted mainly through contaminated drinking water and food. Other transmission routes have been identified, which include transfusion of infected blood products and perinatal transmission. Hepatitis E Virus (HEV) infection is usually self-limiting and resolves within 4–6 weeks. Occasionally, fulminant HEV develops with acute liver failure, which can lead to death. Globally, HEV outbreaks and sporadic cases occur in resource-limited countries with limited access to essential water, sanitation, hygiene and health services, and may affect large numbers of people. In recent years, outbreaks have occurred in areas of conflict and humanitarian emergencies, such as war zones, and in camps for refugees or internally displaced persons (IDP). An estimated 20 million infections and 3.3 million acute cases occur annually worldwide with an estimated 56,600 deaths. HEV infection is associated with increased morbidity and mortality in pregnant women and new-borns. There is no available treatment capable of altering the course of acute HEV, although HEV vaccination exists, it is not widely available. Prevention is the most effective approach against the disease.

As HEV is usually self-limiting, hospitalization is generally not required. However, hospitalization is required for people with fulminant HEV and should also be considered for symptomatic pregnant women. Maintaining standards for public water supplies, establishing proper waste management systems, and maintaining hygienic practices such as hand washing with safe water, particularly before handling food, can reduce the risk of infection and transmission. Avoiding consumption of water and/or ice of unknown purity, and adhering to safe food practices are also useful.

1.3GUIDING PRINCIPLES

The development of this document is aligned with the National Policy for the Control of Viral Hepatitis in Nigeria. This is founded upon the following principles;

1.Universal Health Coverage: Ensuring that all Nigerians can utilize effective, preventive, curative, and palliative high-quality health care services for viral hepatitis. This can be achieved through the following;

- **Accessibility:** The provision of various viral hepatitis services at different levels of the health care system.
- **Affordability:** The uptake of viral hepatitis prevention, care and treatment, as well as support services should be at minimal cost.
- **Availability:** The provision of viral hepatitis testing, vaccination, pharmaceutical, laboratory as well as care and treatment services should be available at various points of care throughout the health care system.
- **Human rights and equity:** The treatment of patients in a client-focused manner through which all patients receive the same level of care irrespective of gender, ethnicity or social status.

2.Government ownership: Government at the Federal, State, and Local levels should commit to ensuring the goal of health for all citizens through provision of appropriate interventions for viral hepatitis infection.

3.Partnerships: Ensuring evidence-based interventions, services and policies through inter-sectorial collaboration, service/programme integration and involvement of affected people and communities.

4.Public health approach: Adopt the principles of public health approach to provide a useful framework to guide a response to viral hepatitis. The approach will include definition of the problem through systematic collection of information about the magnitude, scope, characteristics and consequences of viral hepatitis. It also includes the establishment and implementation of interventions based on research and epidemiological evidence, and monitoring the impact as well as cost effectiveness of interventions.

CHAPTER TWO

MANAGEMENT OF HEPATITIS B

2.1PREVENTION OF HEPATITIS B

2.1.1 Infant and Neonatal Hepatitis B Vaccination

In Nigeria, the current routine immunization schedule for infants includes four doses of HBV vaccine. The first dose is the monovalent HBV vaccine administered within the first 24 hours of life. Subsequent doses of the vaccine are given as a component of the pentavalent vaccine at 6 weeks, 10 weeks, and 14 weeks of age. The Pentavalent vaccine provides coverage for Diphtheria, Pertussis, Tetanus, Hepatitis B and Haemophilus influenza type B.

Recommendation:
This guideline recommends the above schedule as appropriate

Dosage:

Age	HBV Vaccine	Dose	Route
At birth (within 24 hours)	Monovalent	10µg / 0.5 ml	Intramuscular
6 weeks	Pentavalent	0.5 ml	Intramuscular
10 weeks	Pentavalent	0.5 ml	Intramuscular
14 weeks	Pentavalent	0.5 ml	Intramuscular

2.1.2 Prevention of mother-to-child HBV transmission

The currently recommended practice to reduce mother-to-child perinatal transmission or horizontal transmission relies on the administration of HBV vaccine and concurrent administration of hepatitis B immune globulin (HBIG) and also the administration of oral nucleos(t)ide analogues to HBV-infected pregnant mothers in the 3rd trimester (28 weeks upwards) of pregnancy till delivery.

Recommendation:

- All exposed babies (babies born to HBsAg positive mothers) should receive hepatitis B immune globulin (HBIG) intramuscularly in addition to the HBV vaccine. This HBIG must be given within 24 hours of birth with the 1st dose of HBV vaccine. The site of administration for HBV vaccine and HBIG should be different.
- HBV-infected pregnant women with HBeAg positivity should be treated with nucleos(t)ide analogues.

- HBV-infected pregnant women who are HBeAg negative but with high viraemia (≥ 200,000 IU/ml) should be treated with nucleos(t)ide analogues.
- Tenofovir, lamivudine, are the recommended drugs to be used from week 28 till delivery.
  - Entecavir* its safety In pregnancy is not known (ref WHO)

2.1.3. Prevention of hepatitis B transmission in older children, adolescents & adults

- In unvaccinated older children (aged from 1 – 11 years) the recommended schedule is as follows:

  Monovalent HBV vaccine at 0, 1 and 6 months should be administered (dose – 10µg /0.5ml, IM)
- In previously unvaccinated adolescents and adults the recommended schedule is as follows:

  Monovalent HBV vaccine at 0, 1 and 6 months should be administered (dose – 20µg / 1 ml, IM)

  Indication for immunization in these categories:
  - All HBsAg negative individuals should be immunized
  - However, where anti - HBs test is done and titre is ≥ 10 mIU/mL then vaccination is not required
- Special Populations
  - Persons who do not respond to first series of Hepatitis B vaccine should complete a second 3-dose vaccine series. The second vaccine series should be given on the usual 0, 1 and 6-month schedule.
  - For HIV, haemodialysis and other Immuno-compromised individuals, it is recommended that the dose of vaccine should be doubled (dose 40µg / 2 ml) and a fourth dose should be added, following the following schedule – 0, 1, 2, and 6 months

2.1.4 General measures to reduce HBV transmission

Individuals who are HBsAg positive should:

- Adopt correct and consistent condom use during sexual intercourse if the partner is not HBV immune or adequately vaccinated.
- Avoid sharing sharps, razors, toothbrushes, or other personal care items;
- Not donate sperm, blood products or organs;
- Follow standard universal precautions with open cuts or bleeding.

2.1.5 HBV vaccination of household and sexual contacts

Household members and sexual partners of persons with chronic HBV are at increased risk of HBV infection and should be vaccinated if they are negative for HBsAg, anti-HBs,and IgG and anti HBc tests are available, vaccination is recommended when results are negative. Dosing schedules depend on the type of vaccine, age at administration, need for rapid immunization, and previous response to HBV vaccination.

Recommendation:

- Household members and Sexual contacts of persons with Chronic HBV should be vaccinated. *The dose and schedule should be as mentioned above in 2.1.3*

2.1.6 Measures to Reduce Disease Progression in Persons with Chronic Hepatitis B

Alcohol reduction

Significant alcohol intake (>20 g/day in women and >30 g/day in men) can accelerate the progression of HBV- related cirrhosis. It is recommended that a history of alcohol consumption should be taken in all persons with HBV infection, followed by the offer of Brief Intervention (Counselling & health education) for persons with moderate-to-high alcohol intake.

2.1.7 Prevention of hepatitis B transmission in health-care settings

The prevention of hepatitis B transmission in healthcare settings includes

- Hand washing including surgical hand preparation, and use of gloves
- Safe handling and disposal of sharps and waste, safe cleaning of equipment
- Screening of donors, donated blood and blood products.
- Improved access to safe blood
- Vaccination of health care workers
- Build capacity of healthcare personnel
- Post-exposure prophylaxis following needle-stick injury/sexual exposure/mucosal or percutaneous (bite) HBV exposure
  - Wounds should be washed with soap and water, and mucous membranes flushed with water
  - The source individual should be screened for HBsAg, HIV and HCV antibody
  - HBsAg, anti-HBs and IgG anti-HBc should be checked in the exposed individual, to assess whether the individual is infected, immune or non-immune to HBV
  - If the source individual is HBsAg-positive or status is unknown, HBIG (0.06 mL/kg or 500 IU) is given intramuscularly and active vaccination commenced (0, 1 and 6 months) if the exposed individual is non-immune. HBIG and vaccine should be given at different injection sites. HBIG is repeated at 1 month if the contact is HBeAg positive, has high HBV DNA levels or if this information is not known. If the exposed individual is a known non-responder to HBV vaccination, then two doses of HBIG should be given 1 month apart.
  - Anti-HBs titres should be measured 1–2 months after vaccination
- Injection safety in health-care settings - Health care workers are required to use auto-disable syringes for intramuscular, intra-dermal and subcutaneous injections and a sufficient supply of quality-assured syringes with matching quantities of safety boxes in health-care settings. Avoidable unsafe practices ultimately lead to large-scale transmission of blood-borne viruses among patients, health-care providers and the community at large.

Unsafe practices include, but are not limited to the following prevalent and high-risk practices:

- Reuse of equipment to administer injections to more than one person, including reintroduction of injection equipment into multi-dose vials
- Recapping of used needles, and unsafe handling of sharps as they lead to accidental needle-stick injuries in health-care workers, which occur while giving an injection or after the injection
- The use of injections for health conditions where oral formulations are available and recommended as the first-line treatment
- Unsafe sharps waste management, putting health-care workers, waste management

workers and the community at large at risk. Unsafe management of sharps waste includes incomplete incineration, disposal in open pits or dumping sites, leaving used injection equipment in hospital laundry, and other practices that fail to secure infected sharps waste.

2.1.8 Prevention of Sexual Transmission of Hepatitis B Among High Risk Populations

High-risk populations include the following

- Female Sex workers (FSW)
- Male sex workers
- People who inject drugs (PWID)
- Sickle cell anaemia patients
- Inmates of prisons and other correction facilities
- Sexual partners and close contacts of HBV-infected individuals
- Men who have sex with men (MSM)
- Kidney disease patients on maintenance haemodialysis
- Other related high-risk behaviour.

Preventive measures include:

- Promotion of correct and consistent condom use
- Targeting and routine screening of high risk population
- Hepatitis B vaccination
- Developing strategies to increase uptake and complete the hepatitis B vaccination schedule
- Offering peer education interventions to reduce the incidence of viral hepatitis
- Integrated action to increase access to medical and social services for vulnerable persons, victims of rape and discrimination.

2.2 DIAGNOSIS OF HBV

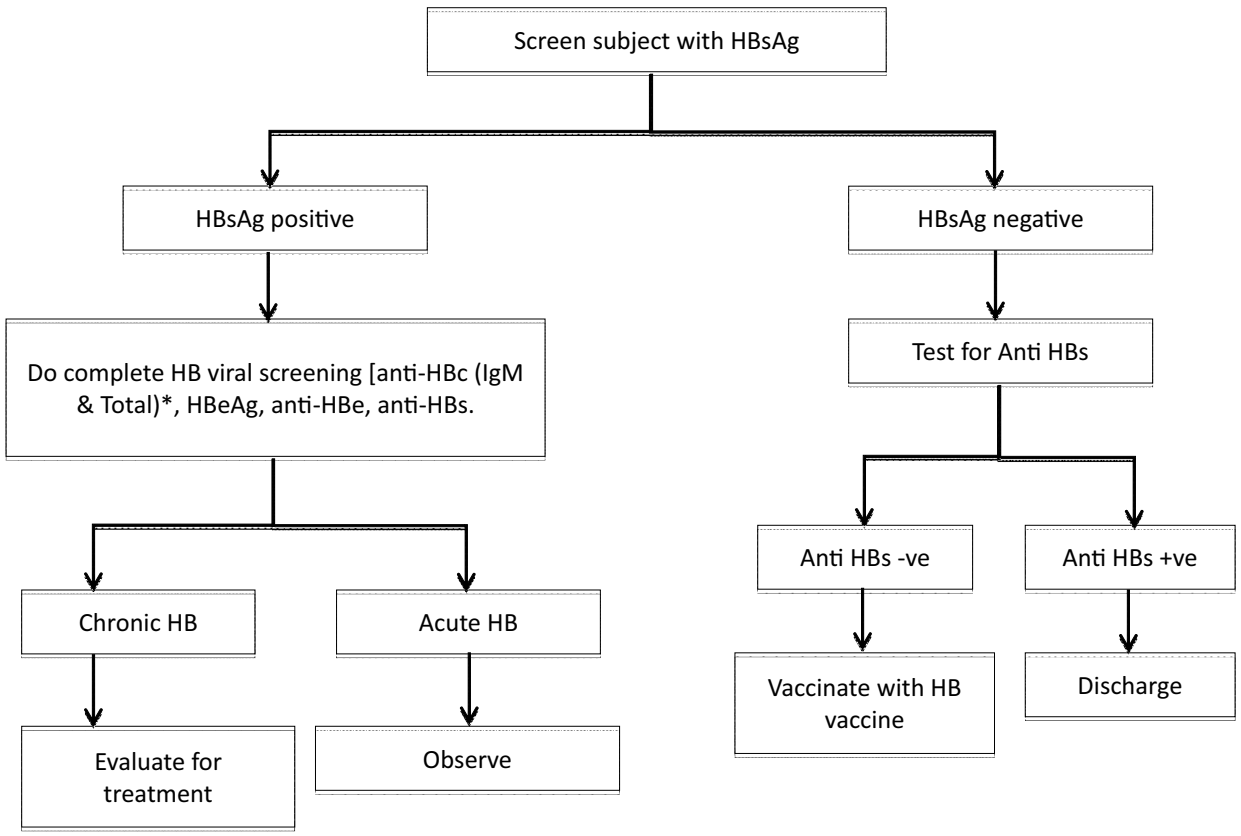
Clinical Evaluation

A detailed history and physical examination of patients are required. Alcohol, drugs and history of other risk factors should be taken. Physical examination is conducted to evaluate for features of chronic liver disease such as jaundice, hepatomegaly, splenomegaly and GI bleeding. The presence of ascites is highly suggestive of decompensated liver cirrhosis. These patients should be considered for treatment prioritization and referred for specialized care.

Recommendation:

Following the identification of an HBsAg positive person the following should be done to confirm diagnosis and assess the patient.

SCREENING AND MANAGEMENT OF HEPATITIS B



*In areas where HBV serology panel is inaccessible a repeat HBsAg test is required in 6 months. Where positive, chronic Hepatitis B is confirmed.

Interpretation of Hepatitis B Serologic Tests /Markers

Test	Results	Interpretation
HBsAg	Negative	Susceptible
Anti-HBc	Negative	
Anti-HBs	Negative	
HBsAg	Negative	Immune due to vaccination
Anti-HBc	Negative	
Anti-HBs	Positive with >10mIU/mL*	
HBsAg	Negative	Immune due to vaccination
Anti-HBc	Positive	
Anti-HBs	Positive	
HBsAg	Positive	Acutely Infected
Anti-HBc	Positive	
IgM anti-HBc	Positive	
Anti-HBs	Negative	
HBsAg	Positive	Chronically Infected
Anti-HBc	Positive	
IgM anti-HBc	Negative	
Anti-HBs	Negative	
HBsAg	Negative	Four Interpretations possible
Anti-HBc	Positive	
Anti HBs	Negative	

Interpretation of Hepatitis B Serologic Tests /Markers

Four interpretations:

1- May be recovering from acute HBV infection.

2- May be distantly immune and the test is not sensitive enough to detect a very low level of anti-HBs in the serum.

3- May be susceptible with a false positive anti-HBc.

4. May be chronically infected and have an undetectable level of HBsAg present in the serum (Occult HBV)

Chronic Hepatitis B (CHB) is defined as the persistence of HBsAg for more than 6 months or presence of chronic liver disease attributable to HBV infection. HBeAg: In persons with CHB, a positive HBeAg result usually indicates the presence of active HBV replication and high infectivity. Post vaccination testing, when it is recommended, should be performed 1-2 months following dose #3.

[19] CDC, Epidemiology and Prevention of Vaccine-Preventable Diseases, The Pink Book: Course Textbook - 13th Edition (2015), http://www.cdc.gov/vaccines/pubs/pinkbook/hepb.html

Assessment of Liver disease

Assessment of hepatic injury/severity:

Liver injury and the severity can be assessed using the following tests: Aspartate transaminase (AST), alanine transaminase (ALT), alkaline phosphatase (ALP), bilirubin, albumin, prothrombin time (PT), ultrasonography.

Liver enzymes: Aminotransaminaselevels may fluctuate with time, and single measurements of ALT and AST do not indicate disease stage. Usually, the ALT concentrations are higher than those of AST, but with disease progression to cirrhosis, the AST/ALT ratio may be reversed. Tests of liver synthetic function and/or portal hypertension include serum albumin, bilirubin, platelet count and prothrombin time (27,28). A progressive decline in serum albumin concentrations, rise in bilirubin and prolongation of the prothrombin time are characteristically observed as decompensated cirrhosis develops.

Full blood count (including platelet count).

Imaging

Ultrasound scan

CT scan where applicable/necessary

Non-invasive tests (NITs):

Non-invasive methods for assessing the stage of liver disease are supplanting liver biopsy and have been validated in adults with CHB. Blood and serum markers for fibrosis, including APRI and FIB-4, as well as commercial markers such as Fibro Test can be estimated, or transient elastography (Fibro Scan) performed to rule out advanced fibrosis (33–35).

Liver Fibrosis Assessment by Non –Invasive Tests

Aspartate aminotransferase (AST)-to-Platelet Ratio Index (APRI) is a simple index for estimating

hepatic fibrosis based on a formula derived from AST and platelet concentrations. For the purpose of early initiation of patients on therapy, the cutoff of 2.0 should be considered. Below is the formula to be used for APRI Score:

APRI Score and Liver Fibrosis Assessment Formula:

$$APRI = \frac{\frac{\text{AST Level}}{\text{AST (Upper Limit of Normal)}}}{\text{Platelets Count (109)/L}} \times 100$$

NB: In this formula the platelet count is expressed in 1000 of platelets per microliter. If the patient has 137,000 platelets per microliter then you use 137 as the denominator in the formula.

An online calculator can be found at: http://www.hepatitisc.uw.edu/page/clinical-calculators/apri

Interpretation of Aminotransferase Platelet Ratio Index (APRI)

APRI Value	*Interpretation*	*Action*
>2	*High Probability (94%) of F4 Cirrhosis*	*Prioritize for treatment*
Between 1 & 2	*Risk of Advanced Fibrosis*	*Consider for treatment*
<1	*Reduced Risk of Advanced Fibrosis*	*Consider for treatment*
<0.5	*Less risk of significant Fibrosis*	*Monitor and/or delay treatment*

Liver biopsy:

Liver biopsy has been used to ascertain the degree of necroinflammation and fibrosis, and to help guide the decision to treat. There are several established methods of scoring histology and measuring activity (necroinflammation) separately from staging (fibrosis). However, limitations of biopsy include sampling error, subjectivity in reporting, high costs, the risks of complications, discomfort to the patient, and the need for training and infrastructure in Low middle income countries (LMICs). The pathological features of CHB on liver biopsy depend upon the stage of the disease, host immune response and degree of virus replication.

Liver biopsy findings should be categorized into mild, moderate or severe chronic necroinflammiation or, better still, semi- quantitatively scored by a scoring system like the KnodellHistological Activity Index (HAI). Comments about degree of fibrosis should also be included.

Recommendation:
To be done by an appropriately trained physician

2.2.2 Evaluation for Antiviral Therapy in HBV infection

Evaluation for Antiviral Therapy in HBV Infection
HBV Infection: Who to treat.

Recommendation:

- As a priority, all adults, adolescents and children with CHB and clinical evidence of compensated or decompensated cirrhosis (or cirrhosis based on APRI score >2 in adults) should be treated, regardless of ALT levels, HBeAg status or HBV DNA levels. (WHO) evidence)
- Treatment is recommended for adults with CHB who do not have clinical evidence of cirrhosis (or based on APRI score< 2 in adults), but are aged more than 20 years, and have persistently abnormal ALT levels and evidence of high-level HBV replication (HBV DNA >20 000 IU/mL), in HBeAg positive patients (APASL, SOGHIN)
- Treatment is recommended for HBeAg negative patients with serum HBV DNA ≥ 2,000IU/ml
- Treatment should be considered based on persistently abnormal ALT levels alone, regardless of HBeAg status, in the absence of other known causes of elevated ALT (SOGHIN)HBsAg +ve patient with a Positive family history of liver cancer should be treated irrespective of other parameters.
- HBV Infection: Who not to treat but continue to monitor

Recommendation:

- Antiviral therapy is not recommended and can be deferred in persons without clinical evidence of significant fibrosis (or based on APRI score<2 n adults), or fibroscan evidence where available and with persistently normal ALT level and low levels of HBV replication (HBV DNA <2000 IU/mL), regardless of HBeAg status. (WHO, APASL,EASL)
- Treatment can be deferred in HBeAg- positive persons aged 20 years or less and persistently normal ALT levels. (SOGHIN)
- Continued monitoring is necessary in all persons with CHB, but in particular those who do not currently meet the above-recommended criteria for who to treat or not to treat, to determine if antiviral therapy may be indicated in the future to prevent progressive liver disease. These include: persons without cirrhosis aged 20 years or less, with HBV DNA levels >2000 IU/ mL but persistently normal ALT (SOGHIN)

Goals of Treatment

a. To achieve undetectable HBV DNA levels
b. To achieve HBeAg ser0-coversion and development of anti –HBe
c. Normalisation of Serum ALT

d. To prevent liver disease progression to cirrhosis, liver failure and liver cancer
e. Loss of HBsAg and development of Anti-HBs
f. To improve quality of life.

Pre-treatment Counselling

It is important that patients are fully informed in simple terms about the following in order to improve compliance:

2. The health implications of chronic HBV infection (liver failure, Cirrhosis –Hardening /scarring of the liver, Liver cancer)
    a. The chronic nature of the disease – monitoring and treatment may be lifelong.
    b. The possibility that spouse(s), children and close relatives may be infected and the need to screen and protect if uninfected.
    c. The need to avoid further health risks such as alcohol, herbal concoctions, *aflatoxins (mouldy groundnuts)multiple sexual partners, tattooing, scarification marks (to avoid risk of co-infections and possibly re-infection in cases of cure)..
3. The financial implications of treatment options in relation to the desired goal of treatment.
4. Potential side effects of the treatment options should be discussed.

The objectives and likely outcomes of treatment should be discussed in terms of virological response, normalization of liver functions and prevention or reduction in the risk of further liver

HBV Treatment Recommendations

- In all adults, adolescents and children age 12 and above, in whom antiviral therapy is indicated, the nucleos(t)ide analogues (NAs) which have a high barrier to drug resistance (Tenofovir is the preferred drug of choice, or with Entecavir as alternative)are recommended. Entecavir is recommended in children aged 2- 11 years or those who cannot tolerate Tenofovir. (WHO). Tenofovir should be avoided in renal impairment.
- Pegylated interferon therapy is recommended in patients for finite treatment who have following parameters:
  Viremia of HBV DNA < 107 IU / ml Elevated serum ALT (> 1x upper limit of normal)

Young patient aged ≤ 45 years(it is approved for use in children aged 2-18years .)

- Pegylated interferon is contraindicated in decompensated cirrhosis

Nas with a high risk of resistance (lamivudine, adefovir & Telbivudine) can lead to drug resistance and are not recommended.

- Telbivudine is preferable in patients with renal impairment,
- Conventional interferon is no longer recommended.

Special Populations

Co – infections

HBV/HCV- Treatment is for the dominant infection while monitoring is for the latent infection, the dominant infection is the infection with the higher viral load.

HBV/HIV- Simultaneous treatment for both diseases; treatment should include drugs effective for both conditions and these include tenofovir+ emtricitabine, in combination with Non-nucleoside reverse transcriptase inhibitor or protease inhibitor.

HBV/HDV- treatment is with Pegylated Interferon for 48 weeks

Chemo/Immunosuppressive therapy

Before commencing chemotherapy, every patient should be screened for HBsAg/anti-HBc as HBV infection may flare on starting treatment. HBsAg positive patients should be started on oral Nucleoside analogues one week before commencement of chemotherapy and continued for 6 months after stopping chemotherapy.

Table 1a. Profile of HBV treatment options

Nucleoside Analogues	RESISTANCE BARRIER	DOSE	DURATION	ROUTE	INDICATION	COST	REMARKS
Tenofovir	Low risk of resistance	300mg dly	Life-long, or until loss of HBsAg/HBeAg positivity	P.O	High viral load	Low	Watch out for Nephrotoxicity
Entecavir	Low risk of resistance	0.5mg dly Lamivudine naïve	Life-long , or until loss of HBsAg/HBeAg positivity	P.O	High viral load	Moderate	Maybe used in place of Tenofovir

Table 1b. Profile of HBV treatment options

Interferons	RESISTANCE BARRIER	DOSE	DURATION	ROUTE	INDICATION	COST	REMARKS
PegylatedInterferon	Not applicable	180mcg wkly	48 weeks	S.C	Low viral load High ALT	high	For finite duration of therapy, Higher HBsAg loss & Higher HBeAg seroconversion

MONITORING AND FOLLOW-UP

Success of therapy is dependent on the proper baseline investigations and monitoring of therapy to determine success and prevent harm to the patient

Baseline investigations to initiate therapy for CHB– in addition to investigations for evaluation include

Serum Electrolyte, Urea and Creatinine for all patients

HIV screening

Exclude non-viral causes of liver disease if suspected (e.g. Liver scan)

Pregnancy test

Psychiatric assessment

HDV test (if available)

Treatment monitoring indices for CHB on Interferon therapy

HBsAg test

White blood cell and Platelet count

HBeAg testing for HBeAg positive patients

HBV DNA

EU,Cr for patients

Serum ALT

Thyroid function test (T3, T4, TSH)

Treatment monitoring indices for CHB on NA Nucleos(t)ide Analogues therapy

HBsAg test

White blood cell and Platelet count

HBeAg testing for HBeAg positive patients

HBV DNA

Serum Creatinine (Cr) for patients

Serum ALT

2.4 MONITORING AND FOLLOW-UP

Success of therapy is dependent on appropriate baseline investigations and patient monitoring for desirable clinical outcomes and reduced risk of harm to the patient.

In addition to investigations for evaluation, the baseline investigation to initiate therapy for CHB includes:

1) Serum Electrolyte, Urea and Creatinine for all patients
2) HIV screening
3) Exclusion of non-viral causes of liver disease if suspected (e.g. Liver scan)

4) Pregnancy test
5) Psychiatric assessment
6) HDV test (if available)

Additionally, treatment monitoring indices for CHB on Interferon therapy

1) HBsAg test
2) White blood cell and Platelet count
3) HBeAg testing for HBeAg positive patients
4) HBV DNA
5) Electrolytes, Creatinine for patients
6) Serum ALT
7) Thyroid function tests (T3, T4, TSH)

Treatment monitoring indices for CHB on Nucleos(t)ide Analogues therapy:

1) HBsAg test
2) HBeAg testing for HBsAg-positive patients
3) HBV DNA
4) Serum Creatinine (Cr) for patients
5) Serum ALT

Table 2. Treatment monitoring for CHB (Nueclos(t)ide analogue Therapy)

BASELINE	4WEEKS	12 WEEKS	24 WEEKS	48 WEEKS	ANNUALLY	REMARKS
HBV viral load		+			+	Monitor annually subsequently (if available)
ALT	+	+	+			
Serum Creatinine	+	+	+			Monitor annually subsequently
HBsAg test					+	Annual monitoring until HBsAg loss
HBeAg test			+			Annual monitoring

Table 3. Treatment monitoring for CHB (Peg-interferon Therapy)

BASELINE	4WEEKS	8 WEEKS	12 WEEKS	24 WEEKS	48 WEEKS	18 MONTHS
HBV viral load			+	+	+	+ (End of monitoring for Interferon)
ALT	+	+	+			
Psychiatric assessment						
WBC & Platelet	+	+	+			
Thyroid function				+	+	
HBsAg test				+	+	+

Table 4. Treatment Endpoint/ indices of CHB

AGENTS	DURATION OF TREATMENT	
	HBeAg positive	**HBeAg negative**
Nucleoside Analogues	6-12 months after HBeAg seroconversion, undetectable serum HBV DNA and appearance of anti HBe	Until HBsAg loss
Pegylated Interferon	48 weeks Sustain Immunological Control HBeAg seroconversion	48 weeks Sustain Immunological Control and Loss of HBs Ag

***Where there are challenges with treatment response refer the patient to the Gastroenterologist/ Hepatologist**

CHAPTER THREE

MANAGEMENT OF HEPATITIS C

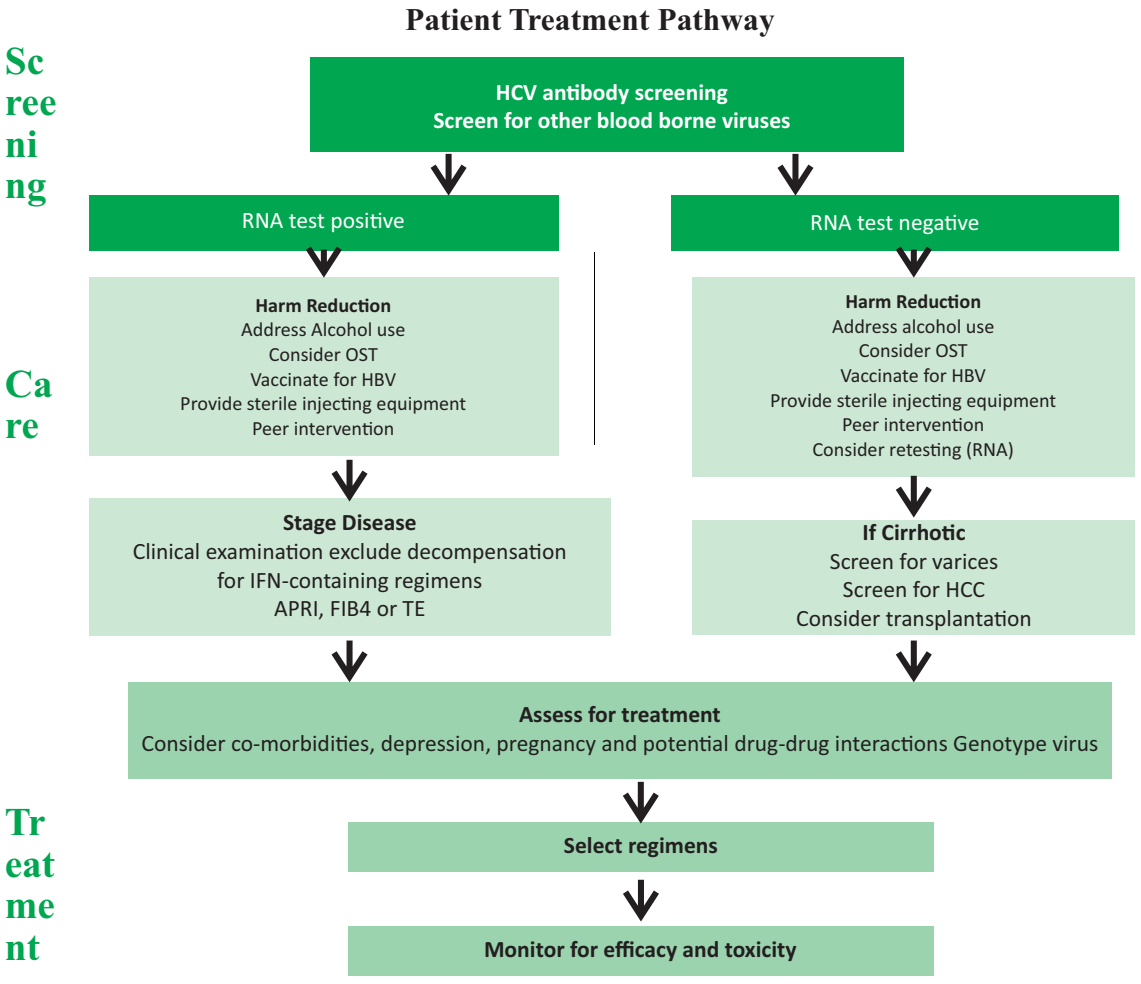
The majority (80%) of HCV infections progress to Chronic Liver Disease (CLD). Outcomes vary widely from subclinical infection to end stage liver diseases (ESLD, 20%) and liver cancer (5%). The more advanced the liver fibrosis, the more severe the disease outcomes. Management of HCV infection requires a comprehensive strategy to prevent and control HCV infection and related chronic liver disease.

3.1 GOALS OF MANAGEMENT

The general goals of management include the following:

a) To achieve a sustained virologic response (SVR) or cure where possible
b) To prevent liver disease progression to cirrhosis, liver failure and hepatocellular carcinoma
c) To prevent transmission of HCV infections
d) To improve quality of life.

A detailed pathway to be followed for the management of hepatitis C is shown in figure 3.1 below



3.2 HCV diagnosis

1. **Screening:**

   Detection of HCV antibodies is the first step to diagnosis. Screening is conducted on whole blood, serum or plasma specimen, using rapid test or Enzyme Immunoassay (EIA) kits that are approved by NAFDAC and other stringent regulatory authorities (FDA, WHO).

   Who to screen:

   - Persons with past history of blood or blood products transfusion or organ transplant
   - People who inject drugs (PWID)
   - Persons with a history of haemodialysis
   - Infants born to HCV positive mothers
   - Contacts of HCV infected persons
   - Health care workers especially those with known history of needle sticks/sharps exposure
   - Clinical evidence of chronic liver disease or abnormal liver enzyme tests
   - Persons living with HIV (PLHIV)
   - Patients with tattoos, scarification marks, or other local surgical procedures
   - Men who have sex with men (MSM), Female sex workers (FSW), and persons with a history of incarceration

2. **Confirmation (Virologic evaluation of HCV infection):**

   Approximately 15–25% of persons who are infected with HCV will spontaneously clear the infection and do not develop chronic infection. These persons are HCV Ab seropositive but no longer infected with HCV. A nucleic acid test (NAT) for HCV RNA, which detects the presence of virus, is needed to distinguish persons with chronic HCV infection from those who have cleared the infection. NAT for HCV RNA is important prior to commencing and during treatment to assess treatment response. NAT can include RNA quantitative or qualitative testing for the detection of HCV RNA and should be performed directly following a positive HCV serological test to establish the diagnosis of chronic HCV infection.

3. **HCV RNA Genotyping:**

   There are six HCV genotypes. (Genotype 1-6) In a HCV RNA positive person, the HCV genotyping should be done to determine optimal treatment **only if** pan-genotypic treatment regimens are un-available.

3.3 Assessment of Liver disease

3.3.1: Clinical Evaluation

A detailed history and physical examination of patients is required. Alcohol, drugs and history of other risk factors are evaluated. Physical examination is conducted to evaluate for features of chronic liver disease such as jaundice, hepatomegaly, splenomegaly and GI bleeding. The presence of ascites is highly suggestive of decompensated liver cirrhosis. These patients should be considered for treatment prioritization and referred for specialized care.

3.3.2: Assessment of hepatic injury / severity

1. Liver enzymes and other tests of liver function:

Liver enzymes include aspartate transaminase (AST), alanine transaminase (ALT), and alkaline phosphatase (ALP). Other tests of liver synthetic function and/or portal hypertension include serum albumin, bilirubin, platelet count and prothrombin time. A progressive decline in serum albumin concentrations, rise in bilirubin, ALT, AST, ALP and prolongation of the prothrombin time are characteristically observed as decompensated cirrhosis develops.

2. Haematological test:

   Full blood count (including platelets count) and test of coagulation such as Prothrombin Time and International Normalized Ratio (INR)

3. Liver Imaging; to evaluate hepatic parenchyma, intra hepatic masses and adnexa
   - Ultrasound scan
   - CT scan where applicable/necessary

3.3.3: Non-invasive tests (NITs) for Liver Fibrosis Assessment

Non-invasive methods for assessing the stage of liver disease are supplanting liver biopsy and have been validated in adults with Chronic HCV. Blood and serum markers for fibrosis, including APRI and FIB-4, as well as commercial markers such as Fibro Test can be estimated, or transient elastography (Fibro Scan) performed to rule out advanced fibrosis.

APRI Score and Liver Fibrosis Assessment:

Aspartate aminotransferase (AST)-to-Platelet Ratio Index (APRI) is a simple index for estimating hepatic fibrosis based on a formula derived from AST and platelet concentrations. For the purpose of early initiation of patients on therapy, the cutoff of 1.0 should be considered. APRI and FIB-4 scores are easily calculated using standard clinical labs. Below is the formula to be used for APRI Score:

APRI and FIB 4 Score calculation:

$$APRI = \frac{\frac{\text{AST Level}}{\text{AST (Upper Limit of Normal)}}}{\text{Platelets Count } (10^9)/L} \times 100$$

NB: In this formula, the Platelets Count is expressed in thousands of platelets per microliter. So, if a patient has 137,000 platelets/µl, we would use 137 as the denominator of the formula.

$$FIB\text{-}4 = \frac{\text{Age [years]} \times \text{AST [IU/L]}}{(\text{platelets } [10^9/L] \times \sqrt{\text{ALT [IU/L]}}).16}$$

ALT - alanine aminotransferase IU - international unit AST - aspartate aminotransferase ULN - upper limit of normal

An online calculator can be found at: http://www.hepatitisc.uw.edu/page/clinical-calculators/apri

Table 3.1. Low and High cut-off values for the detection of significant cirrhosis and fibrosis

	APRI (low-cut off)	APRI (high cut - off)	FIB4 (low cut - off)	FIB4 (high cut - off)	Transient elastography (Fibroscan)
Significant fibrosis (METAVIR = F2)	0.5	1.5	1.45	3.25	7-8.5kPa
Cirrhosis (METAVIR F4)	1.0	2.0	-	-	11-14kPa

Table 3.2. Summary of sensitivity and specificity of APRI, FIB4 and Fibroscan for the detection of advanced cirrhosis and fibrosis (all values are percentages)

		APRI (low-cut off)	APRI (high cut-off)	FIB4 (low cut - off)	FIB4 (high cut-off)	Transient elastography (Fibroscan)
Significant fibrosis (METAVIR ≥ F2)	Sensitivity (95% CI)	82 (77-86)	39 (32-47)	89 (79-95)	59 (43-73)	79 (74-84)
	Specificity (95% CI)	57 (49-65)	92 (89-94	42 (25-61)	74 (56-87)	83 (77-88)
Cirrhosis (METAVIR F4)	Sensitivity (95% CI)	77 (73-81)	48 (41-56)	-	-	89 (84-92)
	Specificity (95% CI)	78 (74-81)	94 (91-95)	-	-	91 (89-93)

3.3.4: Liver biopsy

Liver biopsy has been used to ascertain the degree of necroinflammation and fibrosis, and to help guide the decision to treat. There are several established methods of scoring histology and measuring activity (necroinflammation) separately from staging (fibrosis).

Limitations of biopsy include sampling error, subjectivity in reporting, high costs, the risks of bleeding and pneumothorax, discomfort to the patient, and the need for training and infrastructure in LMICs. Liver biopsy findings should be categorized into mild, moderate or severe chronic necroinflammation.

Using the METAVIR group scoring system:

Fibrosis is staged on a scale of F0 to F4, as follows;

- F0 = no fibrosis.
- F1 = portal fibrosis without septa.
- F2 = few septa (moderate fibrosis).
- F3 = numerous septa without cirrhosis (advanced fibrosis).

- F4 = cirrhosis.

Significant fibrosis is defined by the presence of F2, F3 or F4

3.4 ANTIVIRAL THERAPY

Antiviral therapy is the cornerstone of treatment of chronic HCV infection. With the arrival of new antiviral therapies, a high rate of sustained virologic response (SVR) is possible in almost all patients.

3.4.1: Goal of Antiviral Therapy

The goal of antiviral therapy in patients with chronic HCV is eradication of HCV RNA, which is predicted by attainment of SVR. SVR is defined as aviremia 12 or 24 weeks after completion of antiviral therapy. An SVR confers a 97 to 100 % chance of being HCV RNA negative during long-term follow-up and can therefore be considered as virologic cure of HCV infection. SVR has been associated with decrease in all-cause mortality, liver-related death, need for liver transplantation, hepatocellular carcinoma, and liver-related complications even among those patients with advanced liver fibrosis.

3.4.2: Evaluation for Antiviral Therapy in HCV

1. All patients with HCV infection (confirmed with HCV RNA) should be treated.
2. However, if prioritization is necessary, refer to the table below.

Table 3.3. Indications for treatment of chronic hepatitis C: Who should be treated and when?

Treatment Priority	Patient group
Treatment is indicated	• All treatment-naïve and treatment-experienced patients with compensated and decompensated liver disease
Treatment should be prioritized	• Patients with significant fibrosis or cirrhosis, APRI score ≥1.0 (or equivalent Metavir score of F3 or F4) including decompensated cirrhosis • Patients with HIV co-infection • Patients with HBV co-infection • Patients with an indication for liver transplantation • Patients with HCV recurrence after liver transplantation • Patients with clinically significant extra-hepatic manifestations • Patients with debilitating fatigue • Individuals at risk of transmitting HCV (active injection drug users, men who have sex with me and high-risk sexual practices, women of child bearing age who wish to get pregnant, haemodialysis patients, incarcerated individuals
Treatment should be considered	• Patients with APRI score <1 (or equivalent METAVIR score of F0 -F2
Treatment is justified	• Patients with moderate fibrosis (F2)
Treatment can be deferred	• Patients with no or mild disease (F0-F1) and none of the above-mentioned extra-hepatic manifestations
Treatment is not recommended	• Patients with limited life expectancy due to non liver related comorbidities

3.5 TREATMENT

3.5.1: Pre-treatment Counselling

In order to improve compliance HCV counselling before commencement of HCV treatment should include;

1. The health implications of chronic HCV infection (liver failure, cirrhosis, Liver cancer)
2. The chronic nature of the disease – monitoring may be lifelong
3. The possibility that spouse(s), children and close relatives may be infected and the need to screen and protect if uninfected
4. The need to avoid further health risks such as alcohol, herbal concoctions, aflatoxins (mouldy groundnuts), multiple sexual partners, tattooing, and scarification procedures (to avoid risk of co-infections and possibly re-infection)
5. The financial implications of treatment options in relation to the desired goal of treatment
6. The potential side effects of treatment options
7. The objectives and likely outcomes of treatment in regards to virologic response, normalization of liver function, prevention/reduction in the risk of further liver damage and liver cancer
8. The potential drug-drug or drug-food interactions (see appendix)

3.5.2: Treatment Options

There are many drugs approved for the treatment of Hepatitis C as shown in Table 3.4, which include all oral DAA therapy and interferon based regimen. Treatment regimens and duration depend on the presence or absence of liver cirrhosis in the patient, the viral genotype (for genotype specific regimens), and other factors that may complicate therapy. Several treatment regimens are available (see Table 3.5).

Interferon based regimen are characterized by significant adverse events (flu-like syndrome, anaemia, pancytopenia etc.), long treatment duration and lower efficacy rates. However, antiviral resistance does not occur.

DAAs have revolutionized HCV treatment and improved treatment outcomes. However, antiviral resistance may occur in rare instances. Pan-genotypic DAAs regimens are widely recommended as they provide high efficacy across all genotypes, have excellent safety profiles, and are administered orally. DAAs can be combined with Pegylated interferon to improve efficacy and reduce duration of treatment.

Table 3.4: Existing HCV Medicines and Dosage

Product	Presentation	Dosage
Sofosbuvir	Tablets containing 400mg of Sofosbuvir	One tablet once daily (morning)
Simeprevir	Capsules containing 150mg of Simeprevir	One capsule once daily (morning)
Daclatasvir	Tablets containing 30 or 60mg of Daclatasvir	One tablet once daily (morning)
Sofosbuvir/Ledipasvir	Tablets containing 400mg of Sofosbuvir and 90mg or Ledipasvir	One tablet once daily (morning)
Paritaprevir/Ombitasvir/Ritonavir	Tablets containing 75mg of Paritaprevir, 12.5mg of Ombitasvir and 50mg of Ritonavir	Two tablets once daily (morning)
Dasabuvir	Tablets containing 250mg of Dasabuvir	One tablet twice daily (morning and evening)
	Solution for injection containing 180, 135 or 90μg of PegIFN-α2a	Once weekly subcutaneous injection of 180 μg (or less if dose reduction needed)
PegIFN-α2b	Solution for injection containing 50 μg per 0.5ml of PegIFN-α2b	Once weekly subcutaneous of 1.5 μg/kg (or less if dose reduction needed)
Ribavirin	Capsules containing 200mg of Ribavirin	Two capsules in the morning and 3 in the evening if body weight<75kg or Three capsules in the morning and 3 in the evening if body weight>75≥kg

The choice of HCV treatment regimen should be individualized based on efficacy of treatment and response. However, for a public health approach, a simplified regimen with limited side effects, good efficacy, and oral route of administration is recommended.

Table 3.5. A list of preferred regimens:

PREFERRED REGIMENS FOR THE TREATMENT OF HEPATITIS C		
REGIMEN	**FEATURES**	**MAJOR CONTRAINDICATIONS**
Sofosbuvir/Daclatasvir	Highly efficacious across all genotypes and HIV+ patients	No clinically significant contraindication
	Affordable	
	Well tolerated, short duration, minimum SEs, AEs and drugs interactions	
Sofosbuvir/Ledipasvir (FDC)	Highly efficacious across most genotypes but not indicated for GT 2 & 3	No clinically significant contraindication
	Affordable	
	Well tolerated, short duration, minimum SEs, limited drugs interaction	
Sofosbuvir + Ribavirin	Acceptable cure rates across all genotypes	Pregnancy or unwillingness to use contraception
	More expensive and less tolerable than all-DAAs regimens, but better than Peg-IFN	
	No risk of resistance	
	Can be used across all genotypes but with lower efficacy	Decompensated cirrhosis
		Uncontrolled depression or epilepsy
	Most Expensive	Pregnancy or unwillingness to use contraception
	Least tolerable regimen: injections, frequent SEs and AEs	Poorly controlled hypertension, cardiac failure or diabetes
		Abnormal Hematologic indices (see table 15), Serum Cr >1.5mg/dl
	No risk of resistance	Breastfeeding

Preferred regimen(s) for Public Health Approach (Without Genotyping)

Sofosbuvir + Daclatasvir

- 12 weeks (All Genotypes) for non-cirrhotic patients (APRI < 1.0)
- 24 weeks (All Genotypes) for cirrhotic patients (APRI ≥ 1.0)

Special Considerations for ART patients:

- Increase daclatasvir dosage to 90mg per day when co-administered with Efavirenz
- Decrease daclatasvir dosage to 30mg per day when co-administered with Atazanavir/Ritonavir
- Decrease daclatasvir dosage to 30 mg per day with the antibacterials clarithromycin, telithromycin, erythromycin and the antifungals ketoconazole, itraconazole, posaconazole and voriconazole

Sofosbuvir + Ribavirin:

- 24 weeks for all patients (All genotypes, non-cirrhotic and cirrhotic)
  - Of note, this is a sub-optimal regimen for certain genotypes based on SVR12 rates in clinical trials (AASLD/EASL/WHO treatment recommendations). However, with limited availability of DAAs, it remains a secondary option for Nigeria.

Table 3.6. Preferred regimen(s) if Genotype is available

A.Patients without cirrhosis (APRI <1.0)

Genotype	Sofosbuvir/ Daclatasvir	Sofosbuvir/ Ledipasvir	Sofosbuvir/ Ribavirin	PegIFN/Sofosbuvir/ Ribavirin
1	12 [A/E/S/W]	12[A/W]; 8-12*[E/S]		12 [E/S]
2	12 [A/E/S/W]		12 [A/E/S/W]	12 [E/S]
3	12 [A/E/S/W]		24 [A/E/S/W]	12 [A/E/S]
4	12[E/S/W]	12 [A/E/S/W]		12 [A/E/S]
5	12[E/S]	12 [A/E/S/W]		12 [A/E/S/W]
6	12[E/S]	12 [A/E/S/W]		12 [A/E/S/W]

Notes
A=AASLD 2016 HCV Treatment Guidelines (Treatment naïve patients only)
E=EASL 2015 HCV Treatment Guidelines
S=SOGHIN 2015 Treatment Guidelines
W=WHO 2016 HCV Treatment Guidelines
*8 weeks in treatment naïve if baseline HCV RNA below 6 million IU/ml

Sofosbuvir + Daclatasvir:

- All Genotypes= 12 weeks

Sofosbuvir + Ribavirin:

- Genotype 2= 12 weeks
- Genotype 3= 24 weeks

Sofosbuvir + Ledipasvir:

- Genotypes 1, 4, 5, 6= 12 weeks
- Genotype 1 can be treated for 8 weeks if treatment naïve and HCV RNA below 6 million IU/ml (EASL)

B. Patients with compensated cirrhosis (APR≥1.0)

Genotype	Sofosbuvir /Daclatasvir	Sofosbuvir /Daclatasvir/ Ribavirin	Sofosbuvir /Ledipasvir	Sofosbuvir /Ledipasvir /Ribavirin	Sofosbuvir/ Ribavirin	PegIFN/ Sofosbuvir/ Ribavirin
1	24 [A/E/S/W]	12[E/W]; 24 [A]	12[A]; 24 [E/S/W]	12[W]; 12-24*[E]		12 [E/S]
2	12[E/W]; 16-24 [A]; 24 [S]				16[W];16-20[E/S];16-24[A]	12 [E/S]
3	24[A/S]	24 [A/E/W]			24[A]	12 [A/E/S/W]
4	24[E/S/W]	12[E/W]	12[A]; 24[E/S/W]	12[W]; 12-24*[E]		12 [A/E/S/W]
5	24[E/S]	12[E]	12 [A]; 24 [E/S/W]	12[W]; 12-24*[E]		12 [A/E/S/W]
6	24[E/S]	12[E]	12 [A]; 24 [E/S/W]	12[W]; 12-24*[E]		12 [A/E/S/W]

Notes

A=AASLD 2016 HCV Treatment Guidelines (Treatment naïve patients only)

E=EASL 2015 HCV Treatment Guidelines

S=SOGHIN 2015 Treatment Guidelines

W=WHO 2016 HCV Treatment Guidelines

*Extension of treatment to 24 weeks if treatment experienced and negative predictors of response

Sofosbuvir + Daclatasvir

- All Genotypes= 24 weeks
- Genotype 2= treatment can shortened to 12-16 weeks
- *Special Considerations for ART patients (See Figure 2)*

Sofosbuvir + Daclatasvir + Ribavirin

- Genotype 1= 12-24 weeks
- Genotype 3= 24 weeks
- Genotypes 4, 5, 6= 12 weeks
- *Special Considerations for ART patients (See Figure 2)*

Sofosbuvir + Ledipasvir

- Genotypes 1, 4, 5, 6= 12-24 weeks
- *Special Considerations for ART patients (See Figure 2)*

Sofosbuvir + Ledipasvir + Ribavirin

- Genotypes 1, 4, 5, 6= 12 weeks (EASL recommends extending treatment to 24 weeks if treatment experienced and negative predictors of response such as platelet count <75 x 10^3/ul)
- *Special Considerations for ART patients (See Figure 2*

Sofosbuvir + Ribavirin:

- Genotype 2= 16-24 weeks
- Genotype 3= 24 weeks

3.6 SPECIAL POPULATIONS

3.6.1 HIV and HCV co-infection

Assessment of potential drug-drug interactions is of critical significance in HIV-infected persons who are about to start HCV treatment. Careful consideration of such interactions is important to avoid toxicity and to ensure efficacy of the regimens used to treat both HIV and HCV in order to prevent the development of ARV resistance and increase likelihood of SVR. Reported interactions are updated on a regular basis and therefore consultation with a frequently updated database is strongly recommended

3.6.2 HBV and HCV co-infection

HBV/HCV: HBV and HCV co-infection may result in an accelerated disease course. In this instance, HCV is considered to be the main driver of the disease. Persons co-infected with HBV and HCV can be treated with antiviral therapy for HCV. SVR rates are similar to those of HCV mono-infected persons. After HCV clearance, there is a risk for HBV re-activation and this may require treatment with anti-HBV antiviral therapy

3.6.3 TB and HCV co-infection

Severe concurrent infections such as TB should generally be treated before commencing therapy for HCV. ART should be initiated with persons with HIV-associated TB as soon as possible, regardless of CD4 count. There are limited reported data on the co-management of persons co-infected with HCV, HIV and TB but such cases need sound clinical judgment in order to reduce the additive side-effects, pill burden and drug–drug interactions.

3.6.4 Persons with renal impairment

Both ribavirin and PEG-IFN require dose adjustment in persons with renal failure, and baseline testing of renal function is required before initiating therapy. Hepatic metabolism occurs for PEG-IFNα2a, while PEG-IFNα2b is renally cleared. While a theoretical accumulation of PEG-IFNα2b could occur in persons with haemodialysis, no differences have been reported clinically. All oral DAAs are recommended in this group. However, there are no data regarding the safety of this medication among persons with renal impairment.

3.7 MONITORING AND FOLLOW-UP

3.7.1 Treatment Monitoring

Direct Acting Antivirals

DAA regimens are much better tolerated by patients, as they have fewer adverse events and less likely to be discontinued early

Recommendation:

Treatment monitoring is not generally required when using all-oral regimen, except in the following situations

- Renal impairment: If Sofosbuvir or Ribavirin based regimens are utilized in patients with chronic kidney disease, renal function should be monitored (Creatinine Clearance) as both exhibit renal clearance.

Dose Adjustments

- Ribavirin:
  - Moderate (30-50mL/min)=Alternating doses of 200mg and 400mg every other day
  - Severe (<30mL/min)= 200mg/day
  - ESRD= 200mg/day

  *Note: Sofosbuvir/Ribavirin only recommended for GT 2, 3 as above if genotype known.
- Sofosbuvir:
  - Mild-moderate (30-80mL/min)= No dose adjustment
  - Severe and ESRD= Not recommended
- Ribavirin based regimens: Severe hemolytic anemia with significant initial drops in haemoglobin may occur; therefore careful monitoring should be initiated.
- Direct monitoring of viral replication through NAT (Viral load) testing is not recommended
- Complex patients in specialist care may require more advanced chemistry and haematology monitoring

Pegylated interferon

For pegylated interferon based regimens, the following monitoring tests are recommended

- Monthly haematological and biochemical profile
- Three monthly Thyroid Function Tests
- Monthly evaluation for depression

Patients on pegylated interferon based regimen should be monitored closely for adverse effects as well as response to therapy. Tests to help monitor drug toxicity include the following:

- Complete blood count with differential
- Renal function testing
- Liver function tests (including alanine aminotransferase [ALT] level)
- Thyrotropin level

3.7.2 Confirmation of efficacy

Confirmation of SVR can be done with qualitative or quantitative NAT post-treatment to evaluate virologic response to therapy.

- DAA Regimens: testing at 12 weeks post-treatment (SVR12)
- Interferon-based regimens: testing at 12 weeks post-treatment (SVR12)

Patients who do not achieve SVR should be referred to a specialist and evaluated for re-treatment

3.7.3 Follow-up

Patients with decompensated cirrhosis and HBV/HCV co-infected patients should be referred to specialist centers.

Assessment and follow up for the progression of disease and for evidence of HCC is an essential part of the care of persons with HCV-related cirrhosis. Compensated cirrhosis may also progress over time to decompensated cirrhosis associated with ascites, oesophageal and gastric varices, and eventually to liver failure, renal failure and sepsis, all of which are life-threatening. The diagnosis of decompensated liver disease is based on both laboratory and clinical assessment, and therefore a careful medical examination of patients must be made before starting treatment. Persons with cirrhosis (including those who have achieved SVR) should be screened for HCC with

six-monthly ultrasound examination and α-fetoprotein estimation, and should have endoscopy every 1-2 years to exclude oesophageal varices.

3.8 PROGRAMMATIC APPROACH TO HCV MANAGEMENT

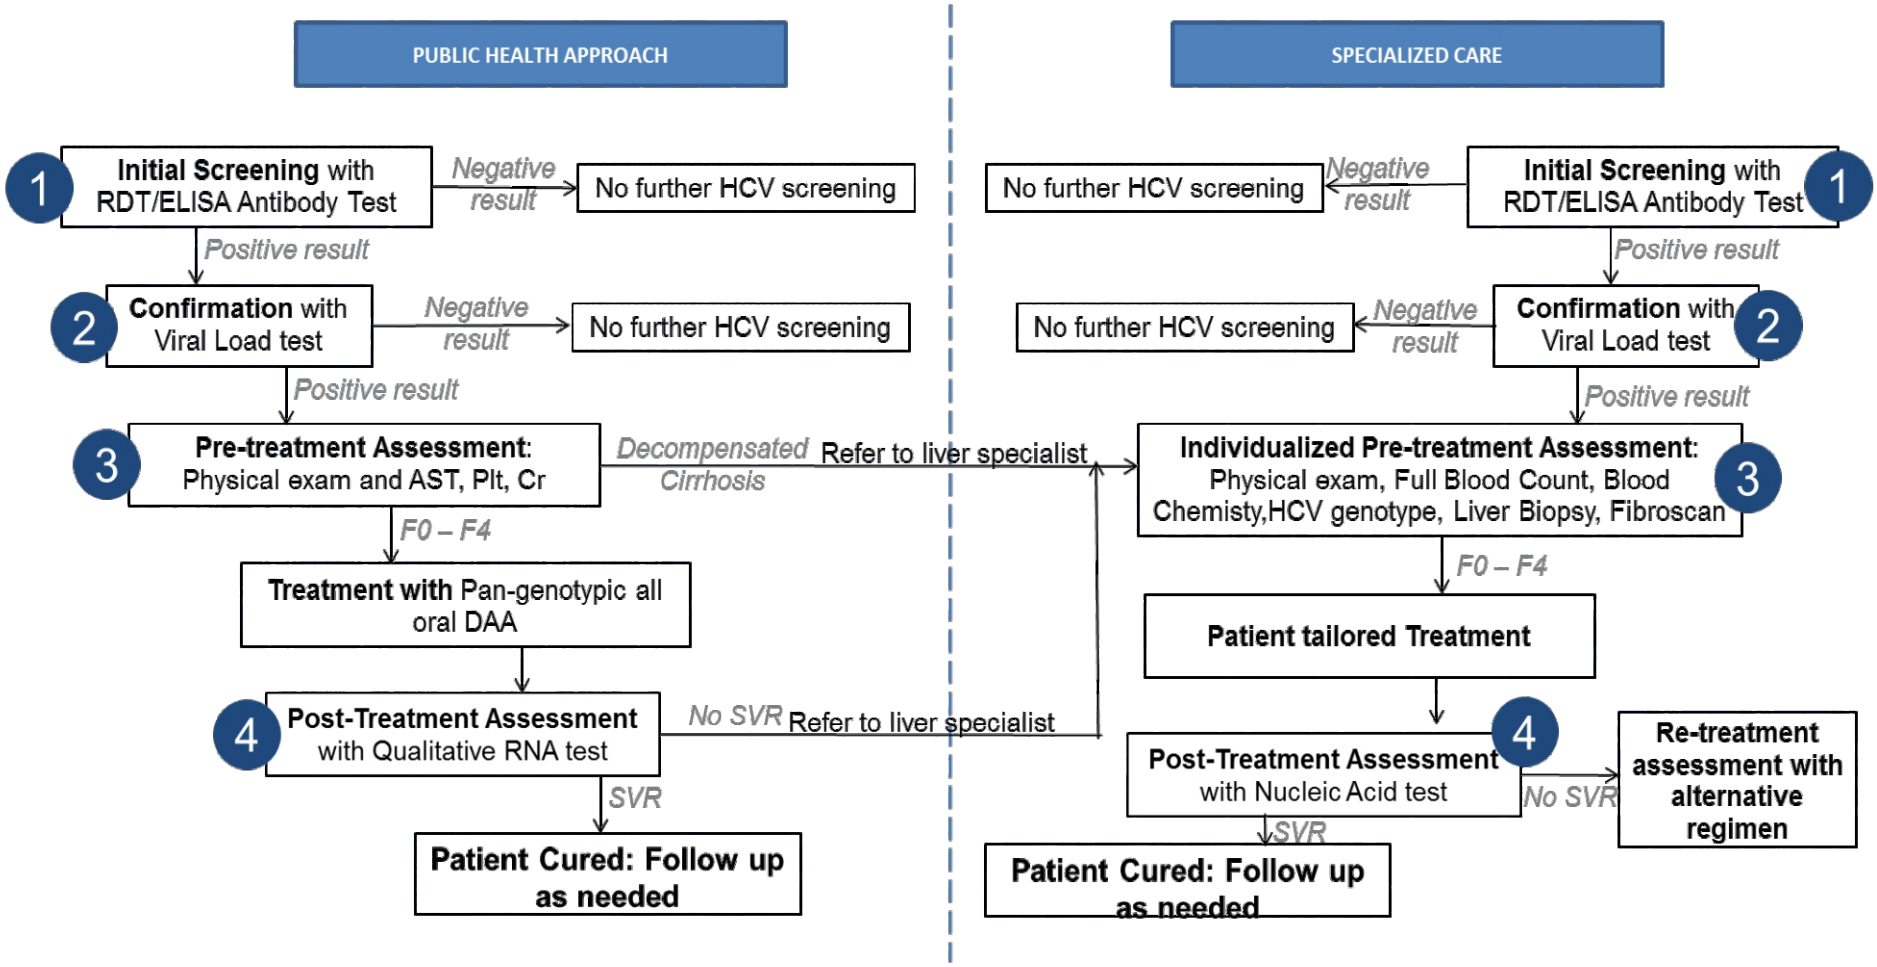


Table 3.7. Implementing the public health approach in HCV therapy

Item	Protocol Section	Specialized Standard of Care Lab Description	Included in public health approach (Yes/No)	Implementation modalities
1	Pre-treatment Screen	**Hepatitis C antibody** (Serum HCV Ab)	**Yes**	The HCV Ab can be performed using an ELISA assay or rapid test. A number of rapid tests are available with differing performance characteristics, such as sensitivity and specificity; which should be considered during selection of screening tests.
2	Pre-treatment Assessment	**Qualitative /quantitative HCV RNA**	**Yes**	Confirmation of chronic HCV is required secondary to false positives during initial screening as well as clearance of previous HCV infection. As with screening tests, NAT performance characteristics should be considered in selection of confirmatory testing platforms.
3	Pre-treatment Assessment	**Physical Exam:** Blood pressure, heart rate, pulse, cardiac, respiratory, abdominal, and neurological exam	**Yes**	Physical examination allows for evaluation of advanced liver disease (decompensated cirrhosis) manifested by evidence of bleeding from varices in the stomach or esophagus, jaundice, ascites (fluid in abdomen), edema of the lower extremities, and mental changes. Individuals with evidence of decompensated cirrhosis will be referred to a liver specialist for management.
4	Pre-treatment Assessment	**HCV Genotype and subtype**	**No**	A pan-genotypic regimen should be adopted.
5	Pre-treatment Assessment	**Platelet** **Hepatic Function Panel:** **Albumin** **Bilirubin** **Alkaline phosphatase** **Alanine aminotransferase and aspartate aminotransferase**	**Yes- AST, Plt** **No- Alb, Bili, Alk Phos, ALT**	AST and Plt allows for calculation of APRI score (AST to Platelet ratio index). APRI is a non-invasive measure of liver damage (advanced scarring (fibrosis) or cirrhosis) and guides treatment duration and ongoing management of liver disease post-SVR. Referral to specialists is not required for patients with APRI>1 and no signs of decompensation, but when/where available should result in liver cancer screening for advanced liver disease (ascites, encephalopathy, GI bleeding) and referral to tertiary treatment centers for evaluation by specialists.
6	Pre-treatment Assessment	**Creatinine/Calculated glomerular filtration rate (GFR):** Measure of kidney function.	**Yes**	One of the medications used in this protocol (sofosbuvir) is renally cleared and there is currently limited safety data in patients with poor kidney function. A GFR <30 ml/min would be an indication to consider delay in therapy until more safety data is available or other regimens are available.
7	Post-treatment Assessment at week 24 (End of Treatment + 12 Weeks)	**At Week 24** (12 weeks after ending treatment): Qualitative HCV RNA	**Yes**	Measurement of sustained virological response (SVR) is recommended at 12 weeks post treatment. If there is no HCV detected in the blood 12 weeks after finishing treatment, the patient has achieved SVR 12 and is considered cured.
8	Post-treatment Assessment at week 24	**At Week 24** (12 weeks after ending treatment): HCV Genotype and subtype	**Maybe**	If SVR12 is not achieved, HCV genotyping and subtyping is recommended. This occurs in a minority of patients; assuming the cost of genotyping at this point significantly decreases overall treatment costs while providing information requisite for future retreatment.

3.9 PREVENTION

To reduce the number of Hepatitis C infections and HCV-related diseases, it is necessary to implement primary, secondary and tertiary prevention methods. Primary prevention methods reduce the risk of contracting the infection. Secondary prevention aims to identify disease at the earliest stage to reduce the impact of disease after it has occurred. Tertiary prevention aims to reduce the impact of on-going illness that has lasting effects.

3.9.1 Primary Prevention Methods

Primary prevention activities reduce the potential risk for HCV transmission from blood, sexual intercourse with infected persons, and exposure to needles (drugs, tattoos, piercings). Precautionary measures should include;

- Educating the public on HCV and modes of transmission and infection
- Not sharing razors, toothbrushes, manicure tools and other items that could be contaminated with blood
- Making sure that sterile equipment is used when getting a tattoo or piercing
- Never sharing IV drug needles or other drug equipment
- Counselling and education to prevent initiation of injecting drugs or risky sexual practices, especially for adolescents
- Counselling those who are at risk for sexually transmitted diseases and drug-related infections on what those individuals can do to minimize their risk of becoming infected

Individuals who use illegal drugs should be advised to;

- Stop using and injecting drugs
- Enter and complete a substance-abuse treatment
- Never share needles If drug use is continued
- Use sterile equipment and clean the site of injection
- Get vaccinated against Hepatitis A and Hepatitis B

Individuals who are at risk for STDs should be advised to;

- Have sex with only one uninfected partner or not to have sex at all
- Use condoms correctly and every time to protect themselves and their partner
- Get vaccinated against Hepatitis B
- If there is a risk for infection, individuals should be routinely tested

3.9.2 Secondary Prevention Methods

Secondary prevention activities reduce risks of chronic disease by identifying the HCV infected individuals through testing and by providing appropriate medical treatments. Methods that should be done include;

- Counselling patients infected with HCV about the disease, treatment methods and what can be done to prevent transmission to other individuals
- Diagnosing at which stage the infection is and implementing appropriate treatment

Precautions that can be taken to prevent the spread of HCV in a hospital setting;

- For transfusion and transplants, thorough screening of the blood is necessary to make sure it is not infected
- Personal protective equipment should be worn at all times by the hospital staff when

dealing with the patients
- Washing hands after and between patients is necessary
- Sharing of non-disposable items between patients should be avoided
- Getting vaccinated against Hepatitis B

Currently, there is no vaccine against HCV because the high mutability of the virus complicates vaccine development.

3.9.3 Prevention of Hepatitis C among at risk populations

- Ensuring safe injection practices in healthcare and community settings
- Ensure safe transfusion of blood and blood products
- Promotion of correct and consistent condom use
- Routine screening of sex workers in high-prevalence settings
- Offer peer education interventions to people who inject drugs to reduce the incidence of viral hepatitis
- Integrated action to eliminate discrimination and gender violence, and to increase access to Medical and social services

CHAPTER FOUR

CARE AND SUPPORT

4.1 DEFINITION

Care and Support, in the context of viral hepatitis B and C, means catering to the needs of people infected with viral hepatitis B and C and providing appropriate support for them, their families and caregivers. Care and Support adds to the holistic, facility based, multidisciplinary and patient-focused care for persons infected.

4.2. CARE AND SUPPORT FOR PEOPLE INFECTED WITH HBV & HCV

4.2.1 Nutritional Support

People with viral hepatitis will thrive best on a balance diet and may need nutritional support to achieve this. However this cannot take place of specific antiviral terrapy Discussed in chapters 2 and 3 above.

The patients should be counselled on the following:

- The need for adequate intake of energy and protein rich foods, fruits and vegetables
- The need for micronutrient supplementation, .
- These micronutrients may enhance the immune status of the patients. They may be found in dark green leafy vegetables, yellow and orange fruits, sweet potatoes, pumpkins, carrots, avocado and tomatoes.
- Patient should be counselled against using herbal medicines as the specific treatment for viral hepatitis
- In situation where chronic Hepatitis B and C has been established, iron supplementation should be discouraged.
- Fatty food should be discouraged.
- Obesity should be discouraged as steatosis may worsen the effect of HCV infections

4.2.2 Lifestyle and Behavioural Change

Behavioural changes that should be encouraged to reduce risk of progression to chronic liver disease and transmission of hepatitis viruses include:

- Cessation of alcohol, smoking, foods containing aflatoxins and recreational drug use

In addition,

- People infected with the hepatitis viruses should be counselled on how to deal with stress and live a healthy lifestyle.
- They should be counselled on how to avoid transmitting the virus to others

4.2.3 Specific Considerations for Viral Hepatitis Positive Pregnant Women

- Hepatitis B screening should be routine during antenatal visit.
- Pregnant women positive for HBV infection should have viral load done in their 3rd trimester and treated with Nucleoside Analogues to reduce the chance of MTCT.

- Babies born to Hepatitis B positive mothers should have Hep B immunoglobins at birth and first dose of monovalent Hep B vaccine within 24 hours of birth.

4.2.4 Disclosure of Hepatitis Status to Children

Disclosing hepatitis infection status to children is a sensitive issue, which must consider the needs, feelings, age, beliefs and understanding of the child and caregiver. It must however be done to improve outcomes in the treatment and care of children.

Importance of Disclosure to Children

- Reduction of developing myths about their infection
- Improvement of access to care and support services
- Enhancement of adherence to treatment and coping strategies
- Reduction of negative psychosocial impact
- It helps to reduce the risk of transmission

Counselling for disclosure in children

This involves counselling the caregivers to support age-appropriate hepatitis infection status disclosure to the child with minimal negative impact. Parents who decline or fail to disclose to their children should be counselled on the importance of the child knowing his/her status, and assisted to do so.

Steps for Counselling hepatitis infected Children and their Families

- Evaluate the child and family for readiness-including child's age and maturity. Five to seven years are earliest recommended ages for disclosure, and all should be disclosed by age 12.
- Ascertain a child's and caregiver's understanding of hepatitis infection
- Explain the benefits of early awareness of hepatitis infection to the child and care giver/family
- Provide on-going psychosocial support.

4.3 IMMUNIZATION

Immunization is an effective way of preventing diseases. Immunizations should be given according to the national immunization schedule. Adults with HCV infection who are hepatitis B negative should have the standard three doses of hepatitis B vaccine.

Human Immunoglobulin (HBIG) as a passive immunization should be made available to those exposed to the virus, and who are hepatitis B negative.

4.4 UNIVERSAL SAFETY PRECAUTIONS

All health facilities in the private and public sector should adopt a policy for the prevention of accidental occupational exposure to blood borne pathogens.

Minimum Standards of Universal Safety Precautions to be observed by health workers include:

- Routine hand washing with soap and water before and after contact with any patient
- Use of barrier precautions eg PEP
- Safe handling and disposal of sharp instruments and equipment, including needles and syringes

- Strict adherence to injection principles
- Do no harm to Self, to the client and to the Community

Materials should be provided for universal precautions. The minimum materials/equipment to be provided include:

- Liquid soap from a dispenser or container
- Running water or a bucket with tap kept full with clean water or a ladle for dipping, if running water is not available
- Single-use towels (paper towels, or cloth towels that will be used once and laundered). If not available, hands should be air-dried.
- SOPs and Job aids to educate personnel on susceptibility to hepatitis virus infection and means of prevention

4.5 Linkages, Networks and Referral Services

Referral is the process by which client needs for treatment, care and support services are assessed and prioritized, and clients are provided with assistance in accessing such services. Referral should also include proactive actions necessary to facilitate initial contact with treatment, care and support service providers. Patients who are screened in primary health centres should have access to treatment and more advanced services in secondary and tertiary level facilities.

Reasons for referral

Clinical services

These include clinical evaluation and management, monitoring the progression to liver disease, more advanced investigation and monitoring for development of HCC Hepato Cellular Carcinoma.(HCC)

Social/Legal support services

Clients who test positive may require legal and/or social services for counselling on how to prevent or deal with discrimination in school, employment, housing and public accommodation.

Community Awareness, Engagement and Participation

The burden of Hepatitis virus diseases is very heavy in Nigeria and to effectively drive the prevention, control and management efforts, and intensification of social mobilization, communication, advocacy, community participation and community engagement strategies at National, State, LGA and Ward levels is very imperative.

It is also very necessary to identify key players/leaders at all levels for advocacy and social mobilization.

Advocacy

- key stakeholders to support Community mobilization to create awareness and demand for the interventions delivered.
- Traditional, religious leaders, NGOs, CBOs, women and youth associations and others as it relates to the area.

SOCIAL MOBILIZATION – Response to Prevention and Control of Hepatitis Virus Diseases

- Messages to change behaviours

- Community dialogues to interact with people to build trust and negotiate for ownership
- Advocacy to leaders to support efforts
- Identify and develop relationship, trust, credibility and sense of ownership with leaders.
- Identify all assets in the nation, state LGA and ward
- Develop appropriate key messages to the level of the audiences.

Communication

- TV,/ Radio drama, songs and music around the community
- Use of informants/educators (mobile public announcement tricycle)
- Rallies
- Road shows
- Use of OB Van to announce benefits, dates, age group and venue of the campaign.
- Identify key women groups to help mobilize their peers. This should include young women within the age group. E.g., FOMWAN, YWCA, etc.
- Identify key influencers / opinion leaders such as youth leaders, NYSC members etc to be part of the mobilization team.
- Develop appropriate key messages for the target age groups. IEC messages could help.
- Sensitization of the community pre and during implementation.
- Engagement of community leaders during micro planning process
- Mobilization of key opinion leaders in the area especially young women and husbands.
- Improve Interpersonal communication skills of Health workers and town announcers

CHAPTER FIVE

ADHERENCE TO ANTIVIRAL THERAPY

5.1 DEFINITIONS

Adherence is a term used to describe the patients' behaviour of taking drugs correctly based on mutual agreement between the patient and health care provider; it involves:

- Taking the right drugs
- The right dose
- The right frequency
- The right time

Adherence also means a patient attending all scheduled clinic visits. Adherence to antiviral treatment is an essential component of individual and programmatic treatment success. Adherence is crucial for delaying or preventing the development of drug resistance to some of the antiviral drugs. The measures to ensure optimal adherence should be undertaken at initiation and during therapy.

5.2 ADHERENCE PREPARATION FOR ANTIVIRAL THERAPY

The success of any adherence strategy depends on the education of patients before the initiation of treatment, an assessment of their understanding of and readiness for treatment. Adherence counselling includes giving basic information on hepatitis B and C infections and their manifestations, and the benefits and side effects of antiviral medications. It also includes how the medications should be taken and the importance of not missing any dose, what to do if doses are missed and steps to be taken to restart therapy if doses are missed. Information and education materials can be particularly useful in this process. Consideration should be given to the patient's lifestyle when possible, and may involve relatives, friends and/or community members as agreed with the patient.

5.3 ONGOING ADHERENCE FOR CLIENTS ON ANTIVIRAL THERAPY

It is essential to continue with adherence counselling. This should involve adherence assessments during every visit andr post treatment follow up.

5.4. MEASUREMENT OF ADHERENCE

Virologic cure for HCV and functional cure for HBV are strongly dependent on adherence to taking the prescribed medications. Adherence in many studies is measured by expressing the number of doses taken as a percentage of the number of doses prescribed. Measurement methods include: patient self-report, pharmacy drug pick-up, pill count, questionnaire and electronic drug monitoring methods.

5.4.1 Factors known to improve Adherence

The following factors have been associated with high adherence rates:

- Increased access to Antiviral Therapy
- Individual patients, family, peers and friends, community members, or treatment-supporter engagement in adherence education
- Family-based care if more than one family member is infected
- Continuous and effective adherence counselling, including knowledge and understanding of hepatitis B and C infection, course of treatment, expected adverse reactions and management of such reactions.
- Drug regimen simplicity e.g. Fixed Drug Combination (low pill burden)

Shorter duration of therapy

- When possible use drugs with less adverse effects.

5.4.2 Factors Associated with Poor Adherence

- Poor patient-caregiver relationship
- Forgetfulness
- Depression
- Lack of patient education
- Drug toxicity
- Severe illness
- Pregnancy related conditions
- Incarceration
- Long duration of treatment
- Lack of social support
- Substance abuse
- Cost of treatment.

5.4.3 Strategies for Improving Adherence

- Treatment education for patients and involvement of treatment partners
- Routine assessment and reinforcement of adherence during follow up
- Fixed dose combination
- Reminders and patient engagement tools (e.g. drug calendars, pill boxes, a reminder call/ SMS text messages, alarm clock)
- Positive feedback on health improvements
- Address adverse events
- Address life-style factors e.g. alcohol abuseAdapting therapy to the client's /patient's lifestyle
- Support groups
- Improved social support.

CHAPTER SIX

MANAGEMENT OF ADVERSE REACTIONS AND COMPLICATIONS OF ANTI HEPATITIS MEDICINES

The therapeutic benefits of medicines should always outweigh the risk. While the safety profiles for medicinal products have been established, adverse events (AEs) are not uncommon. AEs are often encountered with medicinal products in the course of prevention and patient management. AEs are identified and managed on time through effective Pharmacovigilance.

6.1 PHARMACOVIGILANCE; ADVERSE DRUG REACTION (ADR) AND ADVERSE EVENTS FOLLOWING IMMUNIZATION (AEFI)

Pharmacovigilance is the science and activities relating to the detection, assessment, understanding, response and prevention of adverse drug reactions (ADRs) and other potential medicine-related problems including adverse events following immunization (AEFIs). A pharmacovigilance system is designed to monitor the safety of authorised medicinal products and detect any change to their risk-benefit ratio. A pharmacovigilance system like any system is characterised by its structures, processes and outcomes (refer to Good Vigilance Practice). The pharmacovigilance system should be in such a way that public health emergencies and preparedness plans are developed as appropriate.

Adverse Event (AE) is any untoward medical occurrence in a patient or clinical trial participant administered a medicinal product and which does not necessarily have a causal relationship with the treatment.

An adverse event can therefore be any unfavourable and unintended sign (e.g. an abnormal laboratory finding), symptom, or disease temporally associated with the use of a medicinal product, whether or not considered related to the medicinal product.

Adverse drug reaction (ADR) is defined as a response to a drug which is noxious and unintended, and which occurs at doses normally used in man for prophylaxis, diagnosis or therapy of a disease, or for the modification of physiological function.

Adverse event following immunization (AEFI) is any untoward medical occurrence which follows immunization and which does not necessarily have a causal relationship with the usage of the vaccine. If not rapidly and effectively dealt with, can undermine confidence in a vaccine and ultimately have dramatic consequences for immunization coverage and disease incidence.

Reporting of ADR and AEFI requires structures and processes for the collection, recording and transmission of reports of suspected adverse reactions associated with medicinal products for human use to the National Pharmacovigillance Center. These can be achieved by ensuring all stakeholders adhere to their roles and responsibilities as shown in Table 12 below.

Table 12: Roles and responsibilities of stakeholders in the PV system for hepatitis

STAKEHOLDER	RESPONSIBILITIES
FMOH, SMOH, NPHCDA, SPHCDA, State NAFDAC Offices and NAFDAC Headquarters	• Strengthen facility based pharmacovigilance units to ensure that the collected reports are authentic, legible, accurate, consistent, verifiable and as complete as possible for clinical assessment. • Ensure consumers and Healthcare professionals have requisite knowledge to enable them report suspected AR and where necessary immediate investigation should be carried out to ascertain the authenticity of the information.
NPHCDA/ SPHCDA	• Establish systems to ensure counseling of all caregivers on AEFIs and pharmacovigilance. • Investigation backed with laboratory analysis and documentation
Marketing Authorization Holder (MAH)	• Establish mechanisms enabling the traceability of products and systems for the collection and reporting of ADRs/AEFIs, including follow-up of reports while complying with data protection principles. • Ensure that all ADR/AEFI information regarding medicinal products marketed by the MAH, within or outside Nigeria are reported to NAFDAC (refer to MAH guideline and PV policy).
Healthcare providers	• Assess patients for AE at every encounter and report all suspected adverse events using the ADR/AEFI reporting form.
Community/Individuals/CSOs/NGOs and patient groups	• Identify and report all AEs through designated channels (Health facilities, NAFDAC, SMOH, FMOH, SPHCDA, NPHCDA)
NAFDAC	• Receive, investigate, assess, provide feedback and archive information on ADR/AEFIs in compliance with the data protection requirements. • Establish systems for capacity

6.2 CLASSIFICATION OF ADVERSE DRUG REACTIONS

The World Health Organization classifies ADRs into four categories based on the severity grades. Severity is a subjective assessment made by the healthcare provider and/or the patient. Despite being subjective, it is useful in identifying adverse reactions that may affect adherence or that needs prompt intervention. The following guide can be used to estimate the severity grade of ADRs;

Table 13: WHO Severity Grading of ADR

Grade 1 – Mild ADR		Transient or mild discomfort (<48 hours) No limitation of activity No medical intervention or therapy required
Grade 2 – Moderate ADR		Mild to moderate limitation of activity Some assistance may be needed No or minimal medical intervention required
Grade 3 – Severe		Marked limitation of activity Some assistance usually required Medical intervention or therapy required Hospitalization possible
Grade 4 – Life Threatening ADR		Extreme limitation of activity Significant assistance required Significant medical intervention or therapy required Hospitalization or hospice care probable.

Vaccine reactions (AEFI) can be classified into two types:

1. Common, usually minor and self-limiting
2. Rare and serious

An AEFI is considered serious if: it results in death, is life-threatening, requires patient hospitalization or prolongation of existing hospitalization, it results in persistent or significant disability/incapacity, it results in congenital anomaly/birth defect or requires intervention to prevent permanent impairment or damage.

Common adverse events associated with hepatitis vaccinations are as follows;

Hepatitis B vaccine	**Nausea, vomiting, redness of the face, neck, arms, and occasionally, upper chest, drowsiness, sleeplessness, fatigue, pain and tenderness at injection site, pruritus, fever, dizziness, headache, vertigo, swelling at injection site, induration at injection site, erythema, ecchymoses, joint pain, skin rash or welts (may occur days or weeks after receiving the vaccine), blurred o r other vision changes, confusion, difficulty in breathing or swallowing, dizziness, faintness or light headedness when getting up suddenly from a lying or sitting position, itching especially of the feet or hands, muscle weakness, numbness or tingling of the arms and legs, reddening of the skin, especially around the ears, sweating, swelling of the eyes, face, or inside of the nose, unusual tiredness or weakness (sudden and severe), Hard lump, unusual tiredness or weakness, muscle pain, agitation, back pai n or stiffness in neck or shoulder, chills, constipation, diarrhea, difficulty with moving, feeling of warmth, general feeling of discomfort or illness, sore throat, runny nose, lack/decreased appetite, stomach cramps or pain, sudden redness of skin, swell ing of glands in the armpit or neck, trouble with sleeping, unable to sleep, weight loss.**
Hepatitis A vaccine	Tiredness, headache, loss of appetite, nausea, slightly raised temperature (normal temperature is 36-36.8ºC), swelling and induration at injection site.

Table 14: Common laboratory and clinical abnormalities associated with medicines for prevention and management of hepatitis

Tenofovir (TDF)	Tubular renal dysfunction, Fanconi syndrome [Risk factors: Underlying renal disease; Older age; BMI <18.5 (or body weight<50 kg); Untreated diabetes mellitus; Untreated hypertension; Concomitant use of nephrotoxic drugs or a boosted PI], Lactic acidosis or severe, hepatomegaly with, steatosis, [Risk factors: Prolonged exposure to nucleoside analogues; Obesity], Exacerbation of hepatitis B (hepatic flares) [Risk factors: Discontinuation of TDF due to toxicity] Nervous system: Insomnia, headache, dizziness, depression, Fatigue, anxiety, peripheral neuropathy Dermatologic: Skin rash (includes maculopapular, pustular, or vesiculobullous); pruritus; or urticaria, pruritus, Diaphoresis Endocrine & metabolic: Hypercholesterolemia, increased serum triglycerides, Weight loss, glycosuria, hyperglycemia, lipodystrophy Gastrointestinal: Abdominal pain, nausea, diarrhea, vomiting, Increased serum amylase, anorexia, dyspepsia, flatulence Neuromuscular & skeletal: Decreases in bone mineral Density [Risk factors: History of osteomalacia and pathological fracture; risk factors for osteoporosis or bone loss], increased creatinine phosphokinase, weakness, Back pain, arthralgia, myalgia Miscellaneous: Fever Cardiovascular: Chest pain Genitourinary: Hematuria Hematologic & oncologic: Neutropenia Hepatic: Increased serum ALT, increased serum AST, increased serum transaminases, increased serum alkaline phosphatase Renal: Increased serum creatinine, renal failure Respiratory: Sinusitis, upper respiratory tract infection, nasopharyngitis, pneumonia Postmarketing and/or case reports: Angioedema, exacerbation of hepatitis B (following discontinuation), Fanconi's syndrome, hepatitis, hypersensitivity reaction, hypokalemia, hypophosphatemia, immune reconstitution syndrome, increased gamma-glutamyl transferase, interstitial nephritis, lactic acidosis, myopathy, nephrogenic diabetes insipidus, nephrotoxicity, osteomalacia, pancreatitis, polyuria, proteinuria, proximal tubular nephropathy, renal insufficiency, renal tubular necrosis, rhabdomyolysis, severe hepatomegaly with steatosis
Entecavir	Hepatic: Elevated ALT, post treatment exacerbation of hepatitis/ALT flare, deaths due to liver-related causes (e.g. hepatic failure, hepatic encephalopathy, hepatorenal syndrome, upper gastrointestinal hemorrhage; hepatic encephalopathy. On-treatment exacerbation of hepatitis/ALT flares, Elevated AST, lactic acidosis and severe hepatomegaly with steatosis (including fatal cases), severe acute exacerbations of hepatitis B (after discontinuation of therapy). Post treatment exacerbations of hepatitis or ALT flare other such as hepatic failure, hepatic encephalopathy, hepatorenal syndrome, and upper gastrointestinal hemorrhage. Hematologic: Decreased albumin (less than 2.5 g/dL), platelets (less than 50,000/mm3) with hepatic decompensation.

	Gastrointestinal: Elevated lipase, Diarrhea, dyspepsia, nausea, vomiting, elevated amylase, abdominal pain, upper gastrointestinal hemorrhage, peripheral edema, ascites, pyrexia/fever, fatigue, ascites, and pyrexia were reported in patients with hepatic decompensation Oncologic: Hepatocellular carcinoma, Malignant neoplasms, Renal: Creatinine increase of at least 0.5 mg/dL, increase serum creatinine of 0.5 mg/dL and renal failure were reported in patients with hepatic decompensation. Increased serum creatinine, Renal failure Respiratory: Upper respiratory infection, cough, nasopharyngitis, rhinitis Metabolic: Fasting hyperglycemia, decreased blood bicarbonate, Elevated alkaline phosphatase, lactic acidosis. Genitourinary: Hematuria, glycosuria, dysuria. Nervous system: Headache, dizziness, somnolence, insomnia Dermatologic: Erythema, photosensitivity with lethargy Musculoskeletal: Arthralgia, myalgia, back pain
Ribavirin	Respiratory: dyspnea, cough, pharyngitis, rhinitis, and sinusitis, pulmonary infiltrates, pneumonitis, pulmonary hypertension, pneumonia, sarcoidosis, and exacerbation of sarcoidosis. Mechanically ventilated patients may be predisposed to respiratory deterioration. Immunologic: Hypersensitivity reactions (urticaria, angioedema, bronchoconstriction, and anaphylaxis.) Dermatologic: Severe skin reactions including vesiculobullous eruptions, Stevens-Johnson syndrome, erythema multiforme, and exfoliative dermatitis/erythroderma) skin irritation from prolonged drug contact. Alopecia, pruritus dermatitis, dry skin, increased sweating, eczema, lichenoid eruptions and maculopapular rashes. Rash has been reported in patients treated with and health care workers exposed to aerosolized ribavirin. Stevens-Johnson syndrome and toxic epidermal necrolysis have been reported during post marketing. Cardiovascular: angina, arrhythmia, and fatal and nonfatal myocardial infarctions, cardiac arrest, hypotension, bradycardia, bigeminy, tachycardia, hypertension, digitalis toxicity and congenital heart disease. Hematologic: anemia, lymphopenia, neutropenia, thrombocytopenia and leukopenia. Aplastic anemia and thrombotic thrombocytopenic purpura, pancytopenia (marked decreases in red blood cells, neutrophils, and platelets) Ocular: blurred vision, corneal ulcer, Conjunctivitis, Eye irritation, Lacrimation, damage to contact lenses. Gastrointestinal: nausea and vomiting, diarrhea, vomiting, abdominal pain, dry mouth, dyspepsia, constipation, Peptic ulcer, gastrointestinal bleeding, pancreatitis, and colitis. Musculoskeletal: myalgia, arthralgia, musculoskeletal pain, and back pain, Myositis. Nervous system: headache, dizziness (excluding vertigo), memory impairment, Peripheral neuropathy, coma, cerebral hemorrhage, Taste perversion, Hearing impairment, hearing loss. Metabolic: anorexia, weight decrease, Diabetes mellitus, Dehydration, falsely low hemoglobin A1c levels. Psychiatric: irritability/anxiety/nervousness/emotional lability, insomnia, depression, concentration impairment, mood alteration, and agitation. Suicide, suicidal ideation, psychosis, aggression, anxiety, drug abuse/overdose, psychotic disorder, and

	hallucination Endocrine: hypothyroidism General: fatigue, pyrexia, myalgia, headache, and rigors, Fatigue/asthenia, pyrexia, rigors, chills, influenza-like illness, unspecified pain, right upper quadrant pain, pain, chest pain, malaise, Hyperuricemia in association with hemolysis and flushing. Hepatic: hepatic dysfunction, fatty liver, cholangitis, Hyperbilirubinemia, hepatomegaly and ALT. Immunologic: sepsis, osteomyelitis, endocarditis, pyelonephritis, pneumonia, sarcoidosis, systemic lupus erythematosus, rheumatoid arthritis, Resistance mechanism disorders, including viral infection, fungal infection. Genitourinary: Menstrual disorder.
Pegylated Interferon	Nervous system: Dizziness, headache, concentration impairment, Vertigo, syncope, migraine, memory impairment, weakness, hypoesthesia, hyperesthesia, paresthesia, tremor, taste disturbance, somnolence, tinnitus, Influenza-like signs/symptoms, fatigue/asthenia, pyrexia, fatigue, rigors, asthenia, pain, overall resistance mechanism disorders, Fever, chills, chest pain, influenza-like illness, malaise, lethargy, shivering, hot flushes, thirst, infections (fungal, viral, bacterial), peripheral edema, flushing, earache. Musculoskeletal: back pain have been reported in CHC patients. Myalgia, arthralgia, arthritis, muscle weakness, neck pain, musculoskeletal pain and muscle cramps Hematologic: Neutropenia, anemia, lymphopenia, Thrombocytopenia, lymphadenopathy, Neutropenia, anemia and thrombocytopenia Gastrointestinal: Nausea/vomiting, diarrhea, abdominal pain, dry mouth, dyspepsia, Nausea, diarrhea, nausea/vomiting, abdominal pain, vomiting, upper abdominal pain, dysphagia, mouth ulceration, gingival bleeding, glossitis, stomatitis, flatulence, gastritis, gingivitis, cheilitis, constipation and oral candidiasis Psychiatric: Insomnia, irritability/anxiety/nervousness, irritability, depression, anxiety, Concentration impairment, mood alteration, nightmares, aggression, emotional disorders, nervousness, decreased libido, affect lability, apathy, Impairment of desire, sexual satisfaction affected (potentially) and sexual dysfunction Dermatologic: Alopecia, pruritus, dermatitis, dry skin, increased sweating, rash and eczema combination therapy, dry skin, Common: Increased sweating, eczema, psoriasis, urticaria, skin disorder, photosensitivity reaction, night sweats, herpes simplex, lipodystrophy, Injection site reactions and cutaneous necrosis. Hepatic: Elevated ALT Metabolic: Anorexia, weight decrease, decreased appetite and Hyperlactacidemia/lactic acidosis Respiratory: Dyspnea, cough and exertional dyspnea Immunologic: autoimmune phenomena include hypothyroidism, sarcoidosis, systemic lupus erythematosus, rheumatoid arthritis, immune thrombocytopenic purpura, thyroiditis, psoriasis. Cardiovascular: Tachycardia, palpitations, Ocular: Blurred vision, eye pain, eye inflammation, xerophthalmia Post marketing reports: Serous retinal detachment Endocrine: Hypothyroidism, abnormal thyroid laboratory values

	Genitourinary: Chromaturia, Impotence, chromaturia Hypersensitivity: Anaphylaxis, Anaphylactic shock
Sofosbuvir	General: Fatigue, asthenia, pyrexia, chills, influenza-like illness, pain, Chest pain Nervous system: Headache, dizziness, Disturbance in attention, migraine, memory impairment. Gastrointestinal: Increased lipase, Nausea, diarrhea, vomiting, Increased lipase, abdominal discomfort, constipation, dyspepsia, dry mouth, gastroesophageal reflux. Dermatologic: Pruritus, rash, Alopecia, dry skin. Psychiatric Insomnia, irritability, Depression, anxiety, agitation, Severe depression was reported, particularly in patients with history of psychiatric illness. Hematologic: Decreased hemoglobin, anemia, neutropenia, decreased neutrophils, decreased lymphocyte count, decreased platelet count and decreased platelets, Pancytopenia. Cardiovascular: bradycardia (including cases requiring pacemaker intervention), Decreased weight Musculoskeletal: Myalgia, arthralgia, increased creatine kinase, back pain, muscle spasms Respiratory: Dyspnea, cough, Nasopharyngitis, exertional dyspnea Hepatic: Increase bilirubin, (greater than 1.5 times ULN).
Daclatasvir	General: Fatigue, asthenia, influenza-like illness, pyrexia, Hot flush, pain, weight decreased. Nervous system: Headache, Dizziness, migraine Dermatologic: Pruritus, rash, dry skin, alopecia Psychiatric: Insomnia, irritability, Depression, anxiety Hematologic: Anemia, neutropenia, Thrombocytopenia, Decreased hemoglobin, eosinophilia Respiratory: Cough, nasopharyngitis, dyspnea, Exertional dyspnea, nasal congestion, upper respiratory tract infection Gastrointestinal: Diarrhea, nausea, Upper abdominal pain, constipation, flatulence, gastroesophageal reflux disease, dry mouth, vomiting, elevated lipase Musculoskeletal: Myalgia, arthralgia Common: Back pain Metabolic: Decreased appetite Cardiovascular: bradycardia heart block, cardiac arrhythmias Hepatic: Increased ALT, increased AST Increased total bilirubin [Ref] Genitourinary: Urinary tract infection Ocular: Common: Dry eye[Ref]
Ledispavir	Applies to ledipasvir / sofosbuvir: oral tablet General: Fatigue [Ref] Nervous system: Headache Gastrointestinal: Nausea, diarrhea, increased lipase Increased lipase, Lipase elevation was transient and asymptomatic. Psychiatric: Insomnia Hepatic: Increased bilirubin

	Cardiovascular: bradycardia, fatal cardiac arrest, cases requiring pacemaker intervention Musculoskeletal: Increased creatine kinase

6.3 DRUG TOXICITY

Drug toxicity is the unwanted effect of drugs resulting from administration in excess of the required therapeutic dose, or accumulation of drug in the body due to inefficient absorption, distribution, metabolism or excretion. Drug toxicity can be detected clinically (history and clinical examination) and/or through laboratory testing.

In the event of drug toxicity, the offending drug(s) must be discontinued and changed to another drug from within its class. In adverse drug reactions, the patient should be managed based on the classification of the ADR.

6.3.1 Laboratory Toxicity Monitoring

Laboratory monitoring of patients receiving Pegylated interferon based regimens for hepatitis treatment is very important for early detection and prevention of some ADRs. The abnormal laboratory values (laboratory test abnormalities) may be early warning signals preceding the clinical manifestations of some ADRs in patients receiving anti-hepatitis (medicines). The following laboratory tests are desirable for laboratory toxicity monitoring of patients receiving medicines for treatment or prophylaxis:

The severity grading of laboratory test abnormalities may guide prompt intervention and prevent the negative consequences of ADR. The following guide (Table 15) can be used to estimate the severity grade of laboratory adverse events:

Table 15: Severity Grading of Laboratory Adverse Events in Adults and Adolescents

Item	Reference Range	LABORATORY TEST ABNORMALITIES **Grade 1 Toxicity**	**Grade II Toxicity**	**Grade II I Toxicity**	Grade IV Toxicity
HAEMATOLOGY					
Hemoglobin	10.5 - 18.0g/dl	8.0 – 9.4 g/dl	7.0 - 7.9 g/dl	6.5 - 6.9 g/dl	< 6.5 g/dl
Absolute neutrophil count or Granulocyte count	2.0 – 7.5 $x10^9$/L	1 - 1.5$x10^9$/L	0.75 – 0.99$x10^9$/L	0.5 - 0.749 $x10^9$/L	<0.5 x 10^9 /L

Platelet count	100–450 x 10^9/L	70–99x 10^9/L	50 – 69 x 10^9/L	30 – 49 x10^9/L	< 29 x 10^9/L
Total WBC	4.0 – 11.0x10^9/L	2.0-3.9x10^9/l	1.0 – 1.9 x 10^9/L	< 1.0 x 10^9/L	-
CHEMISTRY					
ALT	5.0 – 38U/L	1.25 - 2.5 x ULN	>2.5 - 5xULN	>5.0 -10 x ULN	>10 x ULN
Triglycerides	<1.69 mmol/l	1.69- 2.25 mmol/l	2.26-5.63mmol/l	5.64-13.5mmol/L	>13.56 mmol/L
Cholesterol		>1.0 - 1.3 x ULN	4.52-8.48mmol/L	8.49-13.56mmol/l	>13.56mmol/L
Lactate	< 2 mmol/l	-	2 – 5 mmol/l	5 – 10 mmol/l	>10mmol/l
Glucose (hyperglycemia)	4 – 6 mmol/l	6 – 8 . 9 mmol/l	8.91-13.88mmol/l	13.89-27.76mmol/l	> 27.76mmol/l
Glucose (hypoglycemia)	**4 – 6 mmol/l**	**3.01-3.55mmol/l**	**2.19-3.00 mmol/l**	**1.67-2.18 mmol/l**	<1.67 mmol/l
Amylase	28 - 100U/L	> 1.0 – 1.5 x ULN	> 1.5 – 2.0 x ULN	> 2.0 – 5.0 x ULN	> 5.0 x ULN
Bilirubin	2 – 21µmol/L	1.1 – 1.5 x ULN	1.6 – 2.5 x ULN	2.6 – 5.0 x ULN	> 5.0 x ULN
Lipase	< 1.5 U/mL	> 1.0 – 1.5 x ULN	> 1.5 – 2.0 x ULN	> 2.0 – 5.0 x ULN	> 5.0 x ULN
Creatinine	0.7 – 1.5mg/dl or 62 - 133µmol/L	> 1.0 -1.5x ULN	> 1.5 -3.0 x ULN	> 3.0 -6.0 x ULN	> 6.0 x ULN

Sodium Hyponatraemia	136-145 mmol/l	130 - 135mmol/l	123-129mmol/l	116-122mmol/l	<116mmol/l
Sodium Hypernatraemia	136-145mmol/l	146 - 150mmol/l	151-157mmol/l	158 - 165mmol/l	>165mmol/l
Potassium Hyperkalaemia	3.5 – 5.0 mmol/l	5.1 – 6.0 mmol/l	6.1– 6.5 mmol/l	6.6 - 7.0 mmol/l	>7.0mmol/l
Potassium Hypokalaemia	3.5 -5.0 mmol/l	3.5 –3.0 mmol/l	3.0 –2.5 mmol/l	2.5 –2.0 mmol/l	<2.0mmol/L
Management		Continue Antiviral Therapy, and consult expert		Continue Antiviral Therapy, and consult expert	Consider stopping **Antiviral Therapy** and consult expert
		Lipid imbalances could be managed with exercise, diet and pharmacologically using fibrates and/or statins			

6.4 STEPS TO RECOGNIZE ADVERSE EVENTS (AES)

- Health care workers should;
- Ask and look for any Aes
- Take a detailed history of the patient
- Establish time relationships; as the time from the start of therapy/immunization to the time of onset of the suspected reaction should be logical
- Carry out a thorough physical examination with appropriate laboratory investigations (if necessary)
- Check the known pharmacology of the medicine, intervention or medication given

6.5 PRINCIPLES OF MANAGEMENT OF ADVERSE DRUG REACTIONS AND ADVERSE EVENT FOLLOWING IMMUNIZATION

Ensure routine screening of all patients receiving medicines for signs/symptoms indicating possible AE using the appropriate forms (see Appendix I and II).

- If there are no new signs and/or symptoms indicating possible adverse reactions, continue case management of patients.
- If there are any new signs and/or symptoms indicating possible adverse reactions:
  - Determine the severity of the adverse event(s) using WHO Severity Grading of ADRs
  - If the suspected adverse event(s) is mild (ADR severity grade 1), counsel patients on how to manage the adverse event(s), document intervention and then manage patients as appropriate.

If the suspected adverse event(s) is moderate, severe or life-threatening (ADR severity grade II –

IV), manage the patients' AEs as appropriate and then document intervention, report the adverse events using the Yellow Form and Adverse Event following Immunization Reporting Form.

What Should Be Reported About ADRs?

- All suspected reactions/incidence that occurred after administration of new medicines
- All serious or unexpected (unusual) AEs that one suspects for established or well-known drugs
- If an increased frequency of a given reaction is observed
- All suspected AEs associated with drug-drug, drug-food or drug-food supplement interactions.
- ADRs in special fields of interest such as drug abuse, misuse, medication error, overdose, occupational exposure, pregnancy, breastfeeding mothers and the aged population.
- ADRs related to failure of contraceptives
- Lack of efficacy of a medication, or when suspected pharmaceutical defects are observed
- Reactions suspected of causing death, danger to life, hospital admissions, prolonged hospitalization, or birth defects.
- When in doubt whether the suspected adverse event/reaction is an ADR or not, you must report to the National Pharmacovigilance Centre.
- Only complete ICSRs and AEFI reports should be transmitted to the NPC.
- Components of complete ICSR include identifiable patient, identifiable reporter, event and the drug

All ADRs should be reported on time (refer to guidelines and policy) to the National Pharmacovigilance Centre using the Yellow form approved by the National Agency for food and Drug Administration and control (NAFDAC). Channels for reporting include;

- Health Institutions (PHC, SHC, THC as well as private hospitals)
- NAFDAC State Pharmacovigilance offices
- Zonal Pharmacovigilance office
- NAFDAC headquarters
- PRASCO (Pharmacovigilance Rapid Alert System for Consumer Reporting
- Food and Drug Services Department), FMOH
- All AEFI during routine immunization within 30 days and up to 42 days for mass campaigns.

Antiviral (anti-hepatitis) drugs must be stopped immediately if there is suspected life threatening adverse drug reaction (grade IV) following the provisions of the national guidelines.

When dealing with multiple drugs suspected to be associated with an ADR**,** consider the possibility of a drug-drug interaction. Furthermore, do a label and literature search (consult the NPC and drug information focal person as necessary).

Establish a functional hospital – based pharmacovigilance committee (with a term of reference) in all centers to coordinate medicines clinical pharmacovigilance; refer all cases of AEs to the hospital based PV committee.

6.6 DRUG-DRUG INTERACTIONS

Drug interaction is the modification of the mechanism of action of one drug by another. Drug interactions can be beneficial, of no consequence, or harmful. Multiple drug use ('polypharmacy') is extremely common in patients being managed for CHB and CHC, so the potential for drug-drug interaction is likely. Adverse drug interactions can be catastrophic, but are often avoidable.

It is important to note that Anti-viral drugs are metabolized by the Cytochrome P450 3A4 isoenzyme in the liver. As a result, other drugs metabolized by this enzyme can either raise or lower the level of antivirals or be increased or decreased themselves by these interactions.

Table 16. Drug-Drug Interactions between co-administered HIV and HCV treatment

HIV Antiviral Drugs	Sofosbuvir	Daclatasvir	Ledipasvir /Sofosbuvir	Pegylated IFN	Ribavarin
NRTIs					
Abacavir (ABC)	◆	◆	◆	■	■
Lamivudine (3TC)	◆	◆	◆	■	●
Zidovudine (AZT)	◆	◆	◆	●	●
Tenofovir	◆	■	■	■	■
NNRTIs					
Efavirenz (EFV)	◆	■	■	◆	◆
Nevirapine (NVP)	◆	■	◆	◆	◆
Protease Inhibitors					
Atazanavir (ATV/r)				◆	■
Lopinavir	◆	◆	◆	◆	◆
Ritonavir	◆	■	◆	◆	◆

●*These drugs should not be co-administered*
■*Potential interaction*
◆ *No clinical significant interaction expected*

6.7 PREVENTION OF ADVERSE DRUG REACTIONS

- Applying the principles of rational use of medicines can prevent most ADRs:
- Use of few drugs, whenever possible
- Use drugs that you are familiar with
- Do not change therapy from known drugs to unfamiliar ones without good reason
- All patients commencing medicines should be properly counseled on the ADRs related to the medications and what to do when it occurs or is suspected. The healthcare provider should be knowledgeable about this
- Be vigilant (look for) these adverse effects when initiating therapy and during follow-up visit

CHAPTER SEVEN

PROGRAMMATIC MANAGEMENT OF VIRAL HEPATITIS

The successful implementation of the recommendations in these guidelines and establishment of affordable prevention, treatment and care programs for viral Hepatitis in the public and private sectors will depend on a well-planned process of adaptation and integration into relevant national strategies. Essential operational and service delivery issues will be addressed on an ongoing basis to ensure long-term effectiveness and sustainability of the national Program. This will be achieved by making the best use of available human and financial resources, thereby maximizing retention of patients across the continuum of care. Specifically, efforts will be made to promote task shifting, improve laboratory and diagnostic services; and strengthen procurement and supply management systems.

7.1 DECENTRALIZATION AND INTEGRATION OF SERVICES

Viral hepatitis treatment and care services providers should implement recommendations from this National Guidelines for the decentralization of Treatment Centers. Decentralization and integration of Viral Hepatitis services will contribute to improvement in the accessibility and ownership of services.

Under this arrangement PHCs can offer prevention services such as screening, vaccination, PMTCT and referrals. Trained clinicians can perform treatment initiation.

The key programmatic components of service delivery for Viral Hepatitis care and treatment are adequate clinic infrastructure, human resources, Health Care Workers (HCWs), a referral system, laboratory and diagnostic services, reliable drug supply, monitoring and evaluation, civil society engagement and private sector participation.

7.2 HUMAN RESOURCE DEVELOPMENT

The limited availability of skilled health workers to deliver quality services is a major setback to the attainment of universal access to viral hepatitis prevention, treatment and care. At all levels of service provision, whether at health facility or community-based there should be adequate human resource to cater for the needs of patients. However, this is not the case and as such several interventions should implemented be to boost human resource for Viral Hepatitis.

7.2.1 Training of Health Workers

All health workers involved in the provision of Viral Hepatitis services must have received adequate training prior to offering services and re-trained thereafter.

Training of health workers must conform with globally accepted standards using nationally approved viral Hepatitis training curriculum and manuals

7.2.2 Training of Community Members

Community volunteers should be trained to provide sensitization and mobilization services for viral hepatitis control, using a community directed intervention approach.

7.2.3 Personnel Recruitment and Retention

Governments, agencies and stakeholders at all levels of care should ensure availability of adequate numbers of health workers at all facilities providing viral Hepatitis services.

7.2.4 Task Shifting

Government and implementing agencies at all levels should adopt task-shifting strategies, which involves the rational redistribution of tasks among health workforce teams. It involves health workers undertaking tasks that are not listed in their professional schedule of duties. Task shifting reduces the burden of work on a particular cadre of health worker and increases the efficiency and productivity in health facilities with large volumes of patient. Task shifting applies to the different services that are offered to the community.

7.3 PROCUREMENT AND SUPPLY MANAGEMENT SYSTEMS

Procurement and supply management systems are required to ensure that viral hepatitis commodities, including antiviral medicines, vaccines and laboratory commodities are available in sufficient quantities at all times when they are needed. This depends on adequate financing, forecasting, supply planning, procurement, warehousing, distribution and tracking. The successful administration of this system requires multi-team collaboration including pharmacists, medical officers, medical records personnel, procurement officers, distribution agents, customs and excise officers, shipping agents, manufacturers of the commodities and administrators of health facilities. The very first step is in determining what should be procured and in what quantity.

Drugs and other commodities required for viral hepatitis prevention treatment and care include:

- Vaccines
- Anti-viral drugs
- Rapid test kits and consumables
- Viral load reagents, sample collection kits, and consumables
- Equipment, reagents and consumables for haematology and chemistry laboratory tests

7.3.1 Viral Hepatitis commodities, Storage and Distribution

The commodity distribution process begins when requests are made, processed and the commodities get to the end user through health care providers at service delivery point.

The logistic system for viral hepatitis is aligned with the existing harmonized Logistics Management Information System. The responsibility for maintaining appropriate stock levels rests on the facility logistics team. Facility's replenishment for consumed stock occurs bi-monthly in response to submission of copies of the ordering Combined Report and Request forms. The reports are directly transmitted to the Central Medical Stores and then to the Logistics Unit in the National Programme where they are analysed for various decisions – ranging from routine re-supply to quantification and forecasting and supply planning. Feedback on reports from the facilities is processed by the Logistics Unit of NASCP and communicated to the facilities. When orders are ready for pick-up, distribution agents are notified and the commodities are transported

and delivered directly to the service delivery points.

Table 7.1: National Reporting schedule

Bimonthly Review Period	Report sent to the central
January – February Report	1st – 7th March
March – April Report	1st – 7th May
May – June Report	1st – 7th July
July – August Report	1st – 7th September
September – October Report	1st – 7th November
November – December Report	1st – 7th January

7.3.2 Key features of Nigerian Viral Hepatitis commodities' logistics system

Inventory Control System

The forced ordering ("Pull" system) has two-levels (Central and Facility) and is based on maximum-minimum thresholds. Service delivery points are "forced" to order at the end of the review period (2 months in FMOH program).

The quantity of commodities in the logistics system is tracked as a stock status (i.e. how long stocks will last).

The maximum stock level (4 months of stock in FMOH program) is set high enough to guarantee adequate supply at all times during the ordering cycle, but low enough to prevent overstock and wastage.

The minimum stock level (2 months of stock in FMOH program) is set as low as possible but includes a safety margin to prevent stock-outs.

The stock level in the facility has to be assessed frequently as this will alert the storekeeper in case of the need to place emergency order. The emergency order is done when stock levels drop to 2 weeks of stock; it disregards the review period. The quantity to order is calculated to top up the stock on hand to maximum level.

7.3.3 Logistics Management Information system (LMIS)

One of the primary components of any logistics system is a functional Logistics Management Information System (LMIS) that ensures availability of timely and accurate data for decision-making. These essential data must always be collected for products at all levels.

The three essential data elements include;

Stock on Hand: Describes the quantities of usable stock of commodities available at a particular point in time. Stock-on-hand information guides us when to place an order and how much of each item is in stock. It also guides redistribution decisions.

Consumption: Describes the quantity of commodities used during the report and order cycle. The rate of consumption is the link between the consumer and the supply chain.

Losses and Adjustments: Losses include the quantity of commodities removed from the distribution system for any reason other than usage (e.g. losses, expiry, and damage). Adjustments may include receipt or issue of supplies to or from one facility to another that is not

their usual supplier (e.g. a transfer) or a correction to account for a difference between what was counted during a physical inventory and what was recorded on the inventory control card. Losses/adjustments may therefore be a negative or positive number.

In order to collect and report the above mentioned data items, a number of forms described below were designed for the management of these commodities.

7.3.4 The LMIS Forms /Tools

Inventory Control Card

This tracks the quantity of health commodities (vaccines, anti-viral drugs, etc) in a facility's storage area. This record collects two essential data items: stock on hand and the losses & adjustment data. The Inventory Control Card should always be kept in a facility's storage area.

Daily Consumption Record for Vaccines, Anti-Viral drugs and Daily Usage Record or Register for Test Kits and Reagents

These collect the number of commodities that have been used in the facility daily over a defined period of time. This information is called Consumption data and is one of the essential data items. The Daily Consumption Record for Anti-Viral drugs should be kept with the person(s) who dispenses. The Daily Usage Record for test kits and reagents should be kept with the person(s) who runs the lab tests.

Record for Returning/Transferring Commodities

This is a transactional form that is used in the event that commodities may be required to be returned to the CMS or transferred to another facility at the same level for various reasons ranging from expiry, damage, change in the treatment guidelines, or over-stocking.

Combined Report Requisition Issue and Receipt Form (CRRIRF)

This form summarizes the information that is collected on the Inventory Control Card, Daily Consumption Record, and Daily Usage Record and is sent to the central store on a regular basis. The CRRIRF uses this reported data to calculate the facility order quantities and monitor whether stock is maintained according to plan (no overstock, shortages, or stock outs). Information from this report is critical to a well-functioning logistics system.

Roles and Responsibilities of Logistics personnel

Central Store Pharmacist

- Receives commodities
- Fulfils orders (re-supply)
- Updates Inventory Control Card when commodities are issued or received
- Ensures the storage of commodities according to the storage standards
- Helps to manage commodities in the warehouse
- Generates national-level reports

Central Store Officer

- Ensures the storage of commodities according to the storage standards
- Updates inventory control cards

Facility Pharmacists/Laboratory Scientist

- Completes the daily consumption record and usage record for commodities Documents all transactions in the inventory control cards maintained in the unit
- Orders commodities and issue commodities to the various points of service in the facility
- Completes the CRRIRF at the end of review period
- Collects the daily consumption and usage registers / reports from other locations where commodities are dispensed e.g. PMTCT units and feeder sites
- Sends back unusable commodities that must be returned to the CMS after filling out the record for returning commodities
- Aggregates all usage data from the daily usage register for commodities and enter in the Combined Reports Requisition Issue and Issue Forms and send to the Central Warehouse
- Monitors the management of commodities in the store.

Facility Anti-Viral Team Leader

- Endorses CRRIRF to be sent to the central store

7.4 MONITORING AND EVALUATION

7.4.1 Monitoring implications

Monitoring and evaluation will help programme managers assess the effectiveness of interventions and linkages between services along the cascade of prevention, treatment and care for Hepatitis and related conditions (Fig 7.1). This information is essential to detect and respond to challenges or gaps in programme performance and quality of services. As the programme matures, monitoring individual and population level outcomes, including toxicity and adverse events, drug resistance, viral suppression, mortality, survival and incidence, is also essential to assess its impact.

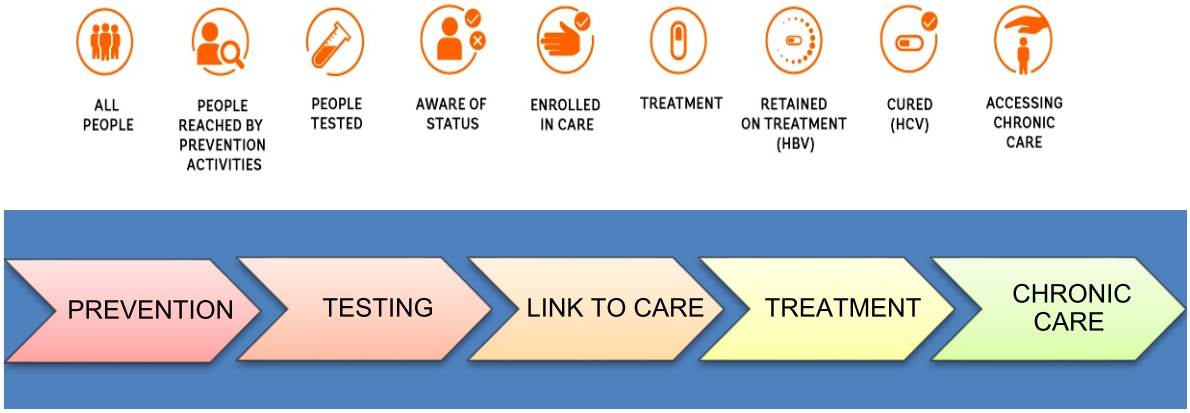

Fig7.1 Viral Hepatitis prevention, treatment and care cascade

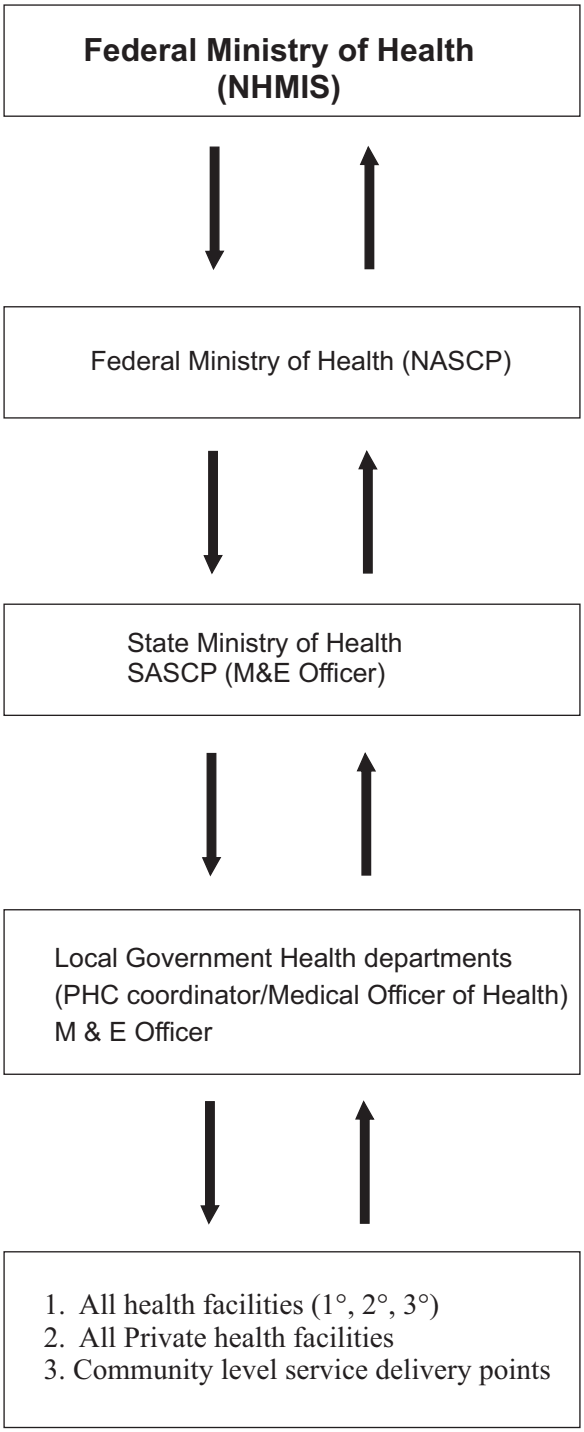
7.4.2 National framework for results-based management

The National framework for results based management will enhance the effective monitoring of strategies and activities towards an effective monitoring of the hepatitis response in Nigeria.

Fig7.2: **Data flow process**



Collection of data will be done through routinely reported data from all facilities or sentinel sites; population-based surveys; surveillance data; observations on cohorts of people living with Hepatitis; and periodic evaluation.

Programme input and processes can also be monitored through facility surveys or updated lists of service availability including documenting the availability and training of human resources and monitoring the availability of Hepatitis medicines and diagnostics at various geographical and service delivery points.

Special studies can be considered to support routine monitoring. In considering how best to collect critical data, efforts should also be made to review monitoring systems, such as better linkage of the monitoring of Hepatitis with HIV, TB and other disease conditions both at the community and facility levels.

7.4.3 Monitoring and Evaluation guidelines for Viral Hepatitis Control Program in Nigeria for State and LGA Health Workers

A guideline focusing on national core indicators, tools and methodology for monitoring and evaluation of viral hepatitis in Nigeria in has been developed. All states and LGAs in Nigeria are expected to collect and use the minimum core indicators as enunciated in the National Health Sector M & E guidelines.

***Objective*:** To provide orientation on viral hepatitis monitoring & evaluation.

Expected Outcome: Users to appreciate the critical role of Monitoring and Evaluation in the implementation of viral hepatitis in Nigeria in order to achieve the strategic targets.

Monitoring: This is a process of tracking the progress and identify challenges of the implementation of planned activities and their outputs (using process/output indicators). This will ensure that activities are carried out in a timely manner, implemented according to planned objectives, ensure judicious use of resources and entrench accountability.

Evaluation: This is a process of measuring **Outcomes** and **Impacts** of interventions. Evaluation of outcomes and impacts is needed to document periodically whether defined strategies and implemented activities leads to expected results in terms of:

- **Outcomes**: e.g. cure rate for HCV, rate of coverage of vaccines etc.
- **Impacts**: e.g. reduction of morbidity, mortality or economic losses.

7.4.4 Monitoring the outputs and outcomes of scaling up access to antiviral drugs

In addition to monitoring the implementation of the strategies, Health Information Systems will also monitor the outputs and outcomes associated with the interventions. Table 7.1 lists areas for gathering data for assessing programmes that lead to anticipated outputs and outcomes at various points along the cascade of hepatitis treatment and care.

Table 7.1: Overview of data areas for monitoring and evaluating the hepatitis treatment cascade

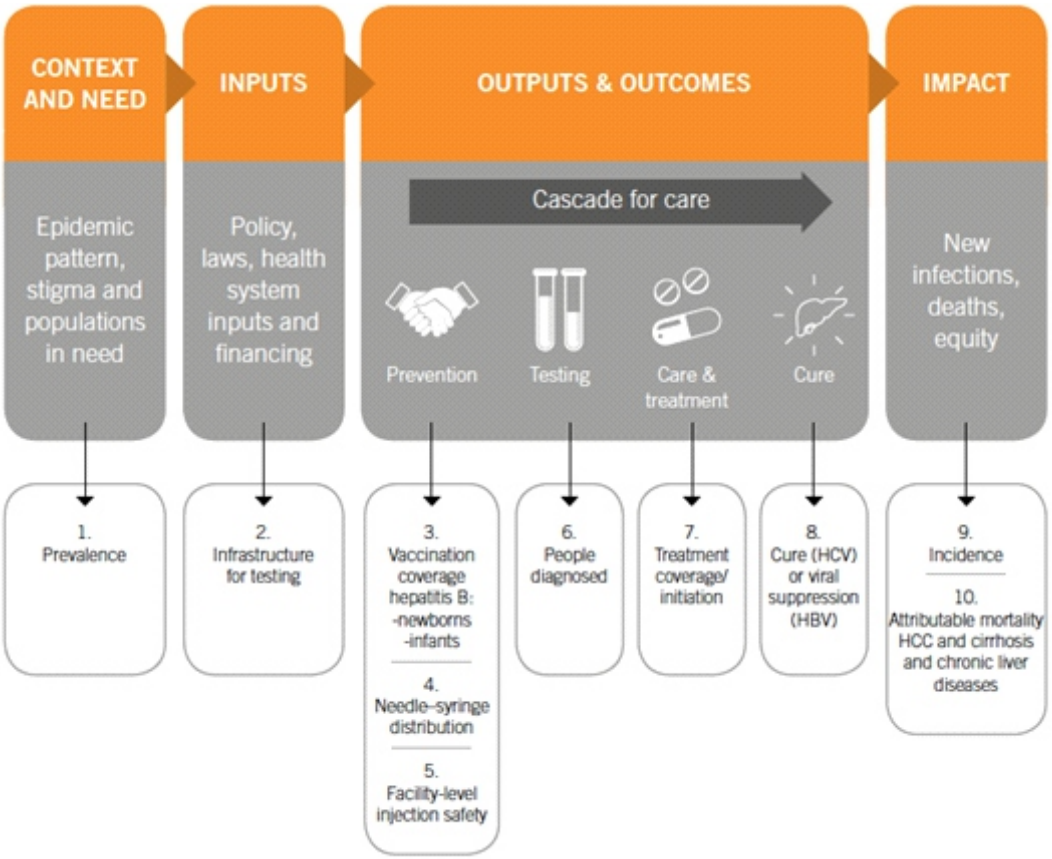
Step in the cascade for care	Indicator areas	Relevance
Epidemic Pattern	Number of people living with hepatitis in various categories	Estimates the prevalence and distribution of people living with hepatitis among the population. Estimates the size of relevant populations and need for hepatitis interventions, to reflect service needs and focus planning
Prevention	Hepatitis B vaccination: new-borns, infants, adults	This indicator monitors and guides immunization programmes to prevent MTCT of HBV
Testing	People diagnosed	Number of people newly diagnosed estimates the proportion of persons with hepatitis who know their status and measures the entry point to the continuum of care, disaggregated estimates can point to gaps in diagnosing people chronically infected with viral hepatitis
Care and Treatment	Treatment coverage/initiation	Measures strength of link between diagnosis and enrolment in care. Indicates access to treatment. Trends over time reflect on progress in treating patients.
Cure	Cure (HCV) or Viral suppression (HBV)	Measures how many are cured among those who completed treatment (HCV), Measures virological suppression achieved among all those currently on treatment regardless of when they started

Table 7.3: Monitoring of the key interventions

Summary of new recommendation areas	Implications for monitoring	Responsible groups
Awareness creation	Data on percentage coverage; number of persons aware of status	NASCP
Viral Hepatitis testing and counselling	Data on percentage coverage; number of persons tested	NASCP
HBV/HCV/HIV testing and counselling	Data on Hepatitis B and C among people in HIV care	NASCP
Persons in care	Data on the number and percentage of different populations (such as adults, adolescents, children and pregnant and breastfeeding women) who are in care based on the eligibility criteria Review of the monitoring system for assessment is needed and how best to collect the relevant data, disaggregated by age and sex	
Persons on treatment including co-morbidities	Data on the antiviral regimen among different population such as adults, adolescents, children, pregnant and breastfeeding women. Monitoring tools may need to be adjusted to reflect regimen options. Monitoring on virologic cure after 12 weeks of treatment for HCV patients Monitoring of the antiviral regimens for the HIV/HBV/HCV co-infected individuals	
Response to treatment and diagnosing treatment failure	Data on percentage of people receiving treatment that had a viral suppression and /or SVR	
Service delivery	Data on retention and adherence among various populations Monitoring of the integration of Hepatitis into facilities providing HIV services, maternal and child health services, STI services and drug dependence services Monitoring the functionality of linkages from HIV, maternal and child health, STI and drug dependence services to hepatitis care and linkages between communities, transfers peripheral facilities and hospitals	
Task shifting	Data on the number of non-physician clinicians, midwives and nurses who are trained in the management of Hepatitis. Monitoring of the number of community health workers who are trained on the management of Hepatitis	

APPENDIX 1

Monitoring and Evaluation Framework: 10 indicators to measure the health sector response

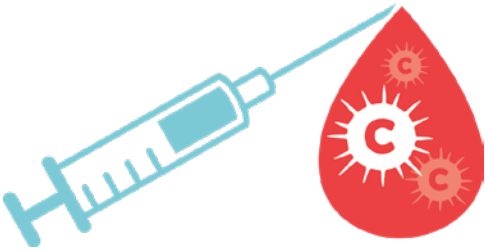


NATIONAL AIDS/STIS CONTROL PROGRAM
FEDERAL MINISTRY OF HEALTH
2016

Introduction to hepatitis C

The word *hepatitis* comes from the Ancient Greek word for liver (*hepar*) and the Latin word for inflammation (*itis*). Chemicals, drugs, excessive alcohol consumption or blood-borne viruses can all cause inflammation to the liver.

What is hepatitis C?



Hepatitis C is an infection caused by the hepatitis C virus that causes inflammation of the liver. Infection can occur through blood-to-blood contact due to unsafe injection and other skin penetration practices, inadequate sterilisation of medical equipment, and the transfusion of unscreened blood and blood products.

Currently, there is no vaccine for hepatitis C virus, as there is for hepatitis A and hepatitis B. A person can be re-infected throughout their life and can live with more than one hepatitis virus at once.

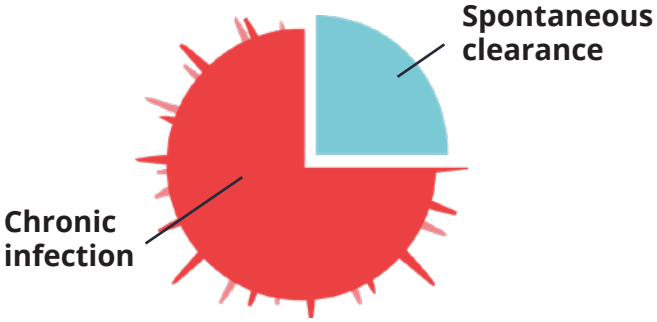
Symptoms and diagnosis

HCV infection can range in severity from a mild illness lasting a few weeks to a serious, lifelong illness.

Common symptoms of acute infection are:

- General aches and pains
- Nausea
- Abdominal pain and discomfort
- Loss of appetite
- Rarely yellowing of the eyes and skin (jaundice)

About 25% of people infected will clear the virus naturally in the first 12 months (**acute infection**).



However, if the infection does not clear up on its own, the virus continues to damage the liver. Of those who are exposed to hepatitis C, up to 75% will go on to develop **chronic infection**.

A person living with chronic hepatitis C may not know they have it because it can take many years for symptoms to appear. Consequently, many people live undiagnosed for years. Some cannot identify how they were infected.

Impact on the liver

Over time Hepatitis C infection can seriously impair liver function, causing fibrosis or cirrhosis (scarring of the liver), and can lead to hepatocellular carcinoma (HCC).

The rate of progression to cirrhosis is variable and depends on several factors, including age of initial infection, male gender, alcohol consumption, co-infections including HIV and hepatitis B virus, and obesity. Around 10-15% of people living with chronic HCV infection will develop cirrhosis within the first 20 years after infection; those who develop cirrhosis are at increased risk of HCC.

Geographical distribution

Globally, there about 70 million people living with hepatitis C, a figure which represents roughly 1% of the population[1] . The regions most affected are Africa and Central and East Asia.

1%

70 million people

Hepatitis C genotypes

There are six main genotypes (viral strains) of HCV worldwide, each with numerous subtypes, and their distribution varies by region. Knowing the genotype is important when making decisions about treatment.

New treatments

Unlike HIV and HBV infection, hepatitis C infection can be cured.

Testing for the virus is simple and the new generation treatments are far more effective, easier to take and have fewer side-effects than the older medications.

[1] The Polaris Observatory HCV Collaborators. Global prevalence and genotype distribution of hepatitis C virus infection in 2015: a modelling study. Lancet Gastroenterology and Hepatology 2016 Dec 15. http://dx.doi.org/10.1016/S2468-1253(16)30181-9

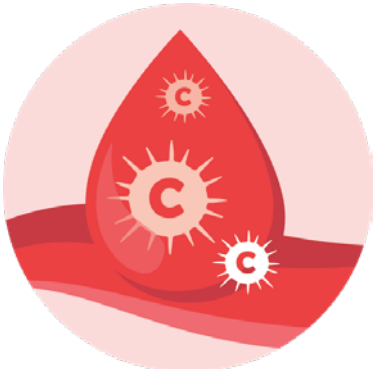
Hepatitis C virus testing and baselining

Has the person ever been exposed to HCV?

Test 1 - The Antibody (Ab) test

A positive HCV Ab result indicates that the person has been exposed to the virus at some point in their life. Note that:

- A positive HCV Ab test result does not distinguish between acute, chronic or cleared infection.
- The presence of HCV antibodies does not provide protection against HCV.



A negative result means that current HCV infection is unlikely. The HCV antibody test has low rates of false negatives or positives. However, this test may need to be repeated if the person has been exposed to risk recently (and possibly tested during the 'window period').

A small number (<5-10%) of immunocompromised hosts, including people living with HIV, may never develop HCV Ab, despite chronic HCV infection. In this case, HCV RNA testing should be performed to diagnose active HCV infection.

Does the person currently have HCV?

Test 2 - The RNA test

This can be determined by ordering a HCV RNA test. This is a test to detect the presence of virus in the blood, by Polymerase Chain Reaction (PCR). The HCV RNA test may be qualitative or quantitative. A positive result confirms the detection of HCV RNA and current viraemic HCV infection.

Ab
Antibody test EVER come into contact with HCV

RNA
Infected with the virus NOW

Ab + + RNA + = **Infected** with HCV **NOW**

Ab + + RNA – = **Infected** with HCV in the **PAST**

Ab – + RNA – = **NEVER** infected with HCV

What HCV genotype do they carry?

AA HCV genotype test is necessary for treatment options that are genotype-specific. HCV genotyping is a routine laboratory test performed during RNA testing.

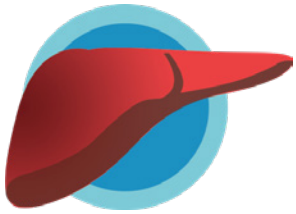
Pan genotypic treatment regimens are also available making all genotypes easier to treat.

Check your local guidelines for what treatment options are available.

What is the HCV RNA level (HCV “viral load”)?

Quantitative HCV RNA at treatment commencement (baseline) may help predict a person’s response to therapy. A low pre-treatment HCV RNA (“viral load”) may allow for a shorter duration of therapy. The length of therapy should be discussed with your local support network who can advise on the most appropriate regimen and its duration.

How is their liver functioning?



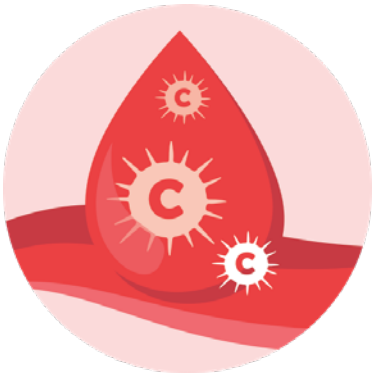
Liver Function tests (LFTs) provide a baseline of current liver function and help identify damage to liver cells. The relevant component tests of a routine LFT are bilirubin, ALP, GGT, ALT and AST. Documentation of the presence or absence of cirrhosis influences treatment regimen and duration.

How hepatitis C spreads

The hepatitis C virus is a blood-borne virus, meaning it's transmitted when the blood of an infected person enters another person's bloodstream. It only takes a small amount of blood to transmit hepatitis C. The virus can live outside of the body for at least four days. In other conditions, it can survive for much longer (e.g. for many weeks inside a syringe).

Understanding the risks

There are many myths about exactly how hepatitis C is transmitted. It is important to know that the riskiest activities are those with the highest potential and frequency of blood-to-blood contact. Those activities that have no chance of exchanging blood are considered no risk. Based on these distinctions, high-risk, some-risk and no-risk activities are outlined below.



High-risk activities

- Unsterile medical or dental procedures and traditional medical practices where the skin is pierced.
- Re-using someone else's injecting equipment for drugs.
- Unsterile tattooing or body piercing.

Moderate-risk activities

- Needle-stick injuries to healthcare workers.
- Mother-to-child transmission may happen during pregnancy or childbirth if mother has hepatitis C.
- Transfused with unscreened blood and blood products.
- Re-using someone else's personal items that may have blood on them, such as razors and toothbrushes.
- Blood-to-blood contact during sex, especially with unprotected anal intercourse.

No-risk activities

If there is no blood-to-blood contact, there is no risk of transmission of hepatitis C. People cannot get or transmit hepatitis C by:

- Sharing toilets, drinking glasses or eating utensils
- Hugging, kissing or touching
- Using swimming pools
- Mosquito or other insect bites
- Coughing or sneezing

Risks for people living with hepatitis C

Understanding how hepatitis C is transmitted is important for people who are living with hepatitis C so they can reduce the chance of:

Being infected with another genotype of hepatitis C.

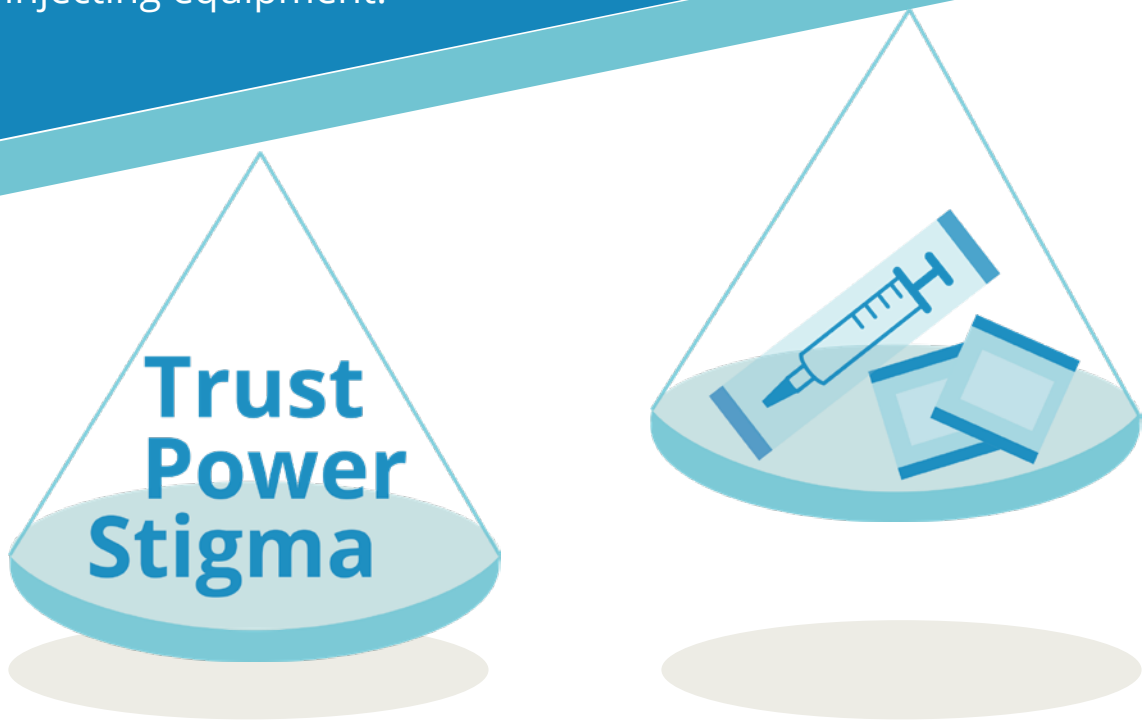
Being re-infected with the same genotype of hepatitis C.

Transmitting hepatitis C to another person.

INHSU

Something to think about: **injecting in the real world**

There are multiple reasons why someone who injects drugs may not feel able to access new, sterile injecting equipment.



Sometimes people who inject drugs may be part of social networks where they are unable to exercise full control over the circumstances in which they inject. For example, in some intimate or familial relationships, voicing an expectation that each person will use their own sterile equipment may be interpreted as implying a lack of trust, making a person uncomfortable or unwilling to jeopardise their relationships in this way.

In other situations, there may be a power imbalance between people who inject together which prevents the person with less power in the relationship from demanding that each person use their own, new equipment. This might be the case, for example, in a relationship between an older man with years of injecting experience and a younger woman who has injected for only a year or two and relies on her partner to purchase and prepare the drugs.

Some people may never have learnt to inject themselves, and rely on others to do it for them. In this case, they are dependent on the person injecting them to be willing to prepare the injections using new equipment, and the experienced injector may be unable or unwilling to do so. In prison, the extremely limited access to injecting equipment means that people who inject drugs in this environment inevitably do so with used equipment.

It is helpful if you acknowledge patients' best intentions while recognising the reality of their lived constraints.

For example, Needle and Syringe Programmes may have uneven distribution. This, combined with stigma and discrimination that some drug users may experience when accessing equipment, and the potential that their confidentiality may be breached and they will be identified as someone who injects drugs, can leave people reluctant to use services.

People may also be reluctant to access NSPs if they feel their eligibility for OST may be threatened, for example if their access points for both OST and sterile equipment are co-located.

If, however, your patient is able to and comfortable accessing their local Needle and Syringe Programme, you could advise them to, where possible, stock up with more injecting equipment than they think they might need ("so there's always some spares, for you or anyone else who might need them"). Patients may also find it useful to make contact with their local peer organisation to access advice and support from people who understand and can relate to their circumstances.

Consent and confidentiality

In your discussions with your patient, you need to ensure they are well informed of the testing process, and you should obtain their verbal informed consent to proceed with testing. You have an opportunity to educate your patient on how to prevent HCV transmission, and assure them of your confidentiality through the discussion.

Gaining informed consent

- Inform the patient of your confidentiality and alleviate any anxiety they have regarding this
- Enquire about their motivation for getting tested
- Provide clear, appropriate information about HCV, including natural history and modes of transmission
- Explain the process of testing, window period and possibility of indeterminate results
- Discuss benefits of early detection
- Assess their ability to cope with positive result and social supports
- Supply written material about HCV (excellent resources for patients are available from www.hepctrust.org.uk)

Conveying test results

- Always give test results in person where possible
- Explain the meaning of the result and discuss immediate implications for the patient
- Avoid overloading the person with information
- Provide emotional support
- Reinforce education about transmission prevention and harm reduction
- Allow adequate time to answer the patient's questions
- Advise on aspects of positive status disclosure
- Arrange any further tests and offer follow-up as required
- Supply written material and contact details for relevant support services and/or peer-based drug users' organisation.

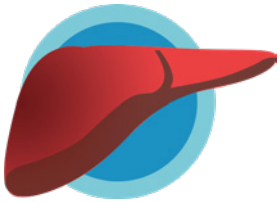
How to test for fibrosis

Once HCV has been diagnosed, the degree of liver fibrosis needs to be determined, as accurate staging will determine appropriate treatment and monitoring.

Non-invasive assessment

Although fibrosis assessment is imperative, liver biopsy is no longer required for most patients with chronic HCV infection. Non-invasive assessment of fibrosis has eliminated the need for biopsy in the majority of patients, and histologic confirmation of clinically evident cirrhosis is not required.

Liver ultrasound



Liver imaging may be used to assess for complications of cirrhosis, including hepatocellular carcinoma and portal hypertension. An ultrasound is preferred over CT scan as the initial investigation to avoid unnecessary radiation.

- If the ultrasound shows an abnormality, such as a nodule, more accurate cross-sectional imaging, such as computed tomography scan or magnetic resonance imaging scan, with and without contrast, would be indicated.

FibroScan®

FibroScan® is most accurate in identifying patients:

- Without significant fibrosis (<7.5 kPa)
- With cirrhosis (>11.5 kPa)

It is important to note that:

- Diagnostic accuracy declines when attempting to determine intermediate stages of fibrosis.
- Liver stiffness is increased independently of the degree of fibrosis in inflammatory liver conditions (E.g. acute HCV infection, acute alcoholic hepatitis or non-alcoholic steatohepatitis).
- Hepatic steatosis may increase the liver stiffness measurement obtained by FibroScan®. Abdominal obesity may overestimate the FibroScan® score – make sure the appropriate sized probe is used for each patient.
- FibroScan® does not give a reason for fibrosis or provide info on other liver pathology.

How FibroScan® works

An ultrasonic transducer sends a vibration wave into the liver. The velocity of the wave correlates with tissue stiffness. The stiffer the liver is, the greater the degree of fibrosis.

FibroScan® examination

Ideally, a patient should have fasted for 4 hours before the procedure.

While the patient is lying down, the probe is placed on the skin over the liver area, typically in the right mid-axillary line. Generally 10 measurements are taken to exclude outliers. The patient feels a gentle 'flick' each time a vibration wave is generated by the probe.

The whole procedure takes 5-10 minutes to perform, causes no discomfort, and results are available immediately.

APRI score

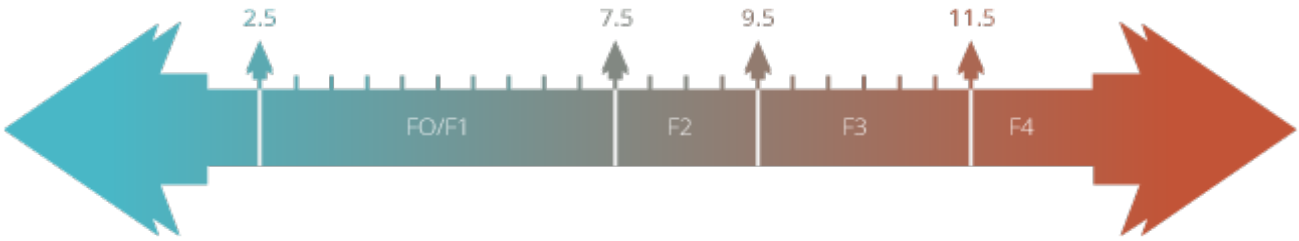
Although serum biomarkers have a role in patient management, they should not be over-interpreted.

In general, FIB-4 or APRI is most accurate for identifying patients at both ends of the spectrum of hepatic fibrosis: those at low risk for early or minimal disease (fibrosis stage 0 to 1) and those at high risk for advanced disease (fibrosis stage 3 to 4).

FibroScan® staging – understanding a FibroScan® result

The FibroScan® provides a numerical score of liver stiffness, which indicates the severity of liver fibrosis.

The diagram below show what FibroScan® scores mean.



Score	2.5 – 7.4	7.5 – 9.4	9.5 – 11.4	> 11.5
Indicates	F0/F1	F2	F3	F4
	No/Mild fibrosis	Moderate fibrosis	Severe fibrosis	Cirrhosis
	Indicates no or minimal liver fibrosis and no evidence of progressive liver disease.	Indicates significant liver fibrosis and evidence of progressive liver disease.	Indicates severe liver fibrosis and high risk progression to cirrhosis.	Indicates extensive liver fibrosis consistent with cirrhosis.

Signs of advanced liver disease

Liver disease, caused by HCV infection, can cause many signs and symptoms. As the disease evolves, signs can appear in many people – but not all, even when cirrhosis is present. Once the disease is well advanced, the features of hepatic decompensation and portal hypertension may appear, including ascites, jaundice, bleeding varices, coagulopathy, encephalopathy and renal failure.

Clinicians need to know what to look for as part of the process for staging liver disease. Cirrhosis severity can be staged by the Child-Pugh, and is based on serum bilirubin, serum albumin, INR, presence of ascites and presence of encephalopathy.

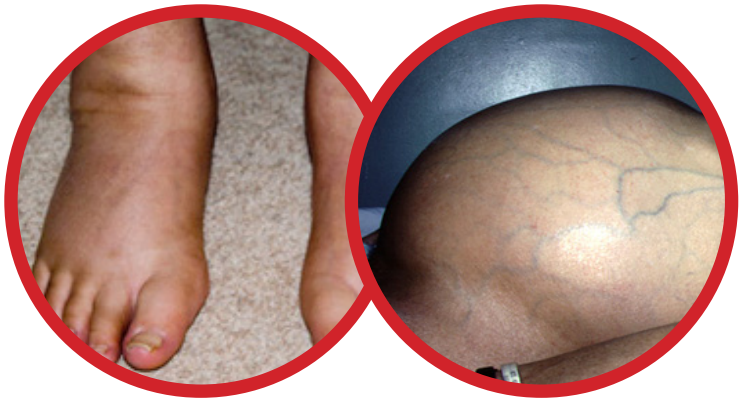
The Fib 4 (Fibrosis 4) score is a non-invasive scoring system based on several laboratory tests that help to estimate the amount of scarring in the liver. A Fib 4 calculator can be found at https://www.hepatitisc.uw.edu/page/clinical-calculators/fib-4.

An Enhanced Liver Fibrosis (ELF) score can also be used to help estimate fibrosis. The ELF score combines quantitative serum concentration measurements of three fibrosis markers. Find out more about ELF scores at www.gpnotebook.co.uk/simplepage.cfm?ID=x2016072075237544321

Physical examination findings in chronic liver disease (of any aetiology) may include hepatomegaly and splenomegaly. A wide variety of non-specific signs (e.g. leukonychia, palmer erythema and gynaecomastia) have been associated with liver disease but these signs are of limited value. It is important to determine whether there are any signs of liver decompensation and the physical examination should focus on looking for these features. If there is doubt as to the severity of the liver disease the patient should be discussed with local experts.

Physical examination findings associated with decompensated liver disease

- Signs of hepatic encephalopathy: Drowsiness, asterixis (or 'hepatic flap')
- Jaundice
- Ascites
- Peripheral edema
- Bruising



Complications of chronic liver disease and cirrhosis

- Portal hypertension – varices on endoscopy
- Ascites – may be detected clinically or on ultrasound examination
- Hypersplenism (with or without splenomegaly)
- Synthetic dysfunction
- Hypoalbuminaemia
- Coagulopathy
- Hepatic encephalopathy
- Hepatocellular carcinoma
- Hepatopulmonary and hepatorenal syndromes

Some of the most common extra-hepatic manifestations of HCV infection are described here.

Immune-mediated

Hematologic

- Mixed cryoglobulinemia (10-25% of HCV people have cryoglobulins but this is rarely symptomatic)
- Cryoglobulinaemic vasculitis
- B-cell non-Hodgkins's lymphoma
- Monoclonal gammopathy
- Immune-mediated thrombocytopenia

Rheumatologic

- Sicca syndrome
- Arthralgia/myalgia
- Autoantibody production (ie, cryoglobulin, rheumatoid factor, ANA, anticardiolipin Ab, antithyroid Abs, anti-SM Ab)
- Polyarteritis nodosa

Inflammatory-related

Renal

- Glomerulonephritis
- Nephrotic syndrome

Endocrine

- Type 2 diabetes mellitus
- Insulin resistance

Central and peripheral nervous system

- Depression
- Cognitive impairment
- Peripheral neuropathy

Systemic

- Fatigue

Dermatologic

- Porphyria cutanea tarda
- Lichen planus
- Cutaneous necrotising vasculitis

Other causes of liver damage

When determining how to treat HCV, other causes of liver disease also need to be identified, as these can influence treatment options.

Identifying other causes of liver disease		
Condition	Test	Comment
Non-alcoholic fatty liver disease	Weight BMI Abdominal ultrasound	Very common
Alcoholic liver disease	History CBC LFT	Raised MCV, AST>ALT, raised triglycerides. History of alcohol consumption.
Hepatitis B infection HIV infection	Serology HBsAg anti-HBs anti-HBc HIV Ab	Vaccinate for hepatitis B if non-immune. Check for viral coinfection.
Haemochromatosis	Iron studies Genetic testing	Prevalence 1:400 but gene penetration is low and disease is much less common than the genotype implies.
Autoimmune liver disease	Auto-antibodies	Uncommon, associated with other autoimmune disease
Medication-induced liver disease	Patient history	
Alpha-1-antitrypsin	Alpha 1 antitrypsin	Rare
Wilson's disease	Family history Ceruloplasmin	Very rare Autosomal recessive Symptoms onset usually in adolescence and early 20s.

Understanding cirrhosis

Assessing liver fibrosis helps determine whether the patient could have cirrhosis. Cirrhosis is a histological diagnosis indicating liver disease with necrosis, collapse of architecture, regeneration, and fibrosis surrounding nodules of liver tissue. Cirrhotic status determines treatment regimen and length of treatment, and determines whether the patient needs specialist care.

Assessing severity

Assessing the severity of liver disease is not an exact science, but we can make an excellent attempt if we have:

- A good history to identify risk, likely duration, confounding factors, current symptoms
- A good physical examination to document any evidence of advancing liver disease
- An understanding of liver function tests and consistent use of these for diagnosis and monitoring
- An understanding of other investigations, which may provide insights into disease severity and/or the nature of the factors contributing to the presentation.

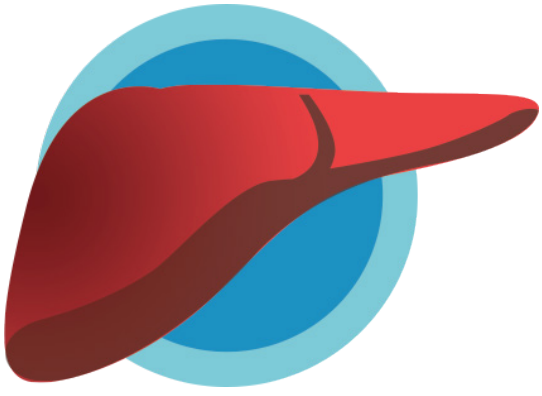
In the presence of cirrhosis and portal hypertension, hypersplenism develops and this leads to reduced haemoglobin, white cell count and platelet count (pancytopaenia). In many, the platelet count falls first and a count of < 100,000 is a surrogate marker of cirrhosis reflecting both the hypersplenism and a reduced production of thrombopoietin by the damaged liver.

Types of cirrhosis

In compensated cirrhosis, no complications have occurred.

Decompensated cirrhosis shows the presence of complications of liver dysfunction and/or portal hypertension. Symptoms include:

- Jaundice
- Hepatic encephalopathy
- Ascites and peripheral oedema
- Variceal haemorrhage



Lab markers of cirrhosis

Blood tests can help identify cirrhosis. Common markers include:

- Reduced platelet count – a count of <100 often indicates cirrhosis
- Lower albumin, total protein
- Lower platelets
- Increased globulin
- Prolonged INR or PT
- Increased bilirubin
- Liver enzymes elevation AST>ALT

Low albumin and platelets <150 are early markers of cirrhosis.

How to assess

Cirrhosis can be assessed through FibroScan® and APRI scores, described in the **HCV Testing** resource.

The Child-Pugh score is a scoring system that can also be used to measure the severity of chronic liver disease inclusive of cirrhosis. A higher score indicates worsening liver function. The score is calculated using several categories:

- total bilirubin, µmol/l (mg/dl)
- serum albumin, g/l
- INR
- presence of ascites
- presence of hepatic encephalopathy

Due to the complexity of managing cirrhosis, it is recommended that patients are managed in conjunction with your local liver unit.

Co-factors in the development of cirrhosis

- Heavy alcohol intake (>4 standard drinks per day)
- Co-infection with HIV or HBV
- Obesity
- Insulin resistance and/or metabolic syndrome
- Autoimmune liver disease – AICAH, PBC, PSC
- Metabolic disorders – haemochromatosis, Wilsons
- a-1 antitrypsin deficiency
- Primary biliary cirrhosis, primary sclerosing cholangitis, biliary atresia
- Chronic inflammatory conditions (e.g. sarcoidosis)

HCV treatment and pregnancy

Administration of PEG-IFN and/or ribavirin in pregnancy is contra-indicated. Animal studies have demonstrated that ribavirin causes birth defects and/or foetal deaths while PEG-IFN is abortifacient.

Ribavirin

Treatment with ribavirin is not recommended during pregnancy or for women who are unable or unwilling to adhere to use of adequate contraception. This includes women who are receiving ribavirin themselves; and/or women who are sexual partners of male patients who are receiving ribavirin.

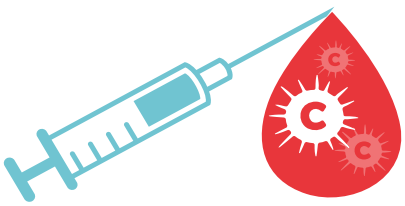
Daclatasvir

Although there is no data regarding daclatasvir for pregnant women, administration is not recommended.

In animal reproduction studies in rats and rabbits, embryo-foetal toxicity was observed in maternally toxic doses that produced exposures of 33 and 98 times the human exposure, respectively, at the recommended human dose of 60 mg.

Other treatments

Other HCV DAA drugs it is recommended that pregnancy is avoided (including sofosbuvir, sofosbuvir/ledipasvir, sofosbuvir/velpatasvir, ombitasvir/paritaprevir/ritonavir, dasabuvir, grazoprevir/elbasvir, glecaprevir/pibrentasvir). They should be used during pregnancy only if the potential benefit justifies the potential risk to the foetus.



Given the lack of data, nursing mothers are advised to discontinue breastfeeding prior to commencement of HCV drug therapy.

Patients and pregnancy

Clinicians will need to advise patients who are either planning to become pregnant, or who are already pregnant, about how to manage treatment.

Planning pregnancy

Female patients who have received ribavirin, and female sexual partners of male patients who have received ribavirin should not become pregnant for at least 6 months after stopping ribavirin.

Pregnant

- Treatment with PEG-IFN and/or ribavirin is contra-indicated.
- Given lack of data, HCV DAAs should be used during pregnancy only if the potential benefit justifies the potential risk to the foetus.

Co-morbid conditions

When deciding on the appropriate HCV treatment, other causes of chronic liver disease (or factors which may affect the progression of liver disease) should be excluded as their presence can impact treatment.

Co-morbid conditions to consider include, but are not limited to:

- HIV
- Hepatitis B virus infection
- Alcohol misuse
- Non-alcoholic steatohepatitis (related to the metabolic syndrome, obesity, diabetes mellitus)
- Hemochromatosis
- Autoimmune hepatitis
- Drug-induced liver injury
- Right ventricular failure

Factors which impact on choice and delivery of HCV treatment include:

- Mental health issues
- Drug and alcohol use (as a marker of lifestyle stability)
- Cardiac disease
- Chronic renal disease
- Advanced decompensated liver disease

Specialist referral should be sought for the following:

- Extra-hepatic manifestations of HCV
  1. Mixed cryoglobulinemia
  2. Renal disease (i.e. membrano-proliferative glomerulonephritis)
  3. HCV-associated lymphoma (i.e. diffuse large B cell lymphoma [DLBCL]).
- Transplant recipients
- Hemoglobinopathies
- Bleeding disorders

How to address co-morbid conditions in HCV treatment

HIV

- There is no apparent impact of HIV co-infection on DAA efficacy. There is, however, lower SVR with interferon-based treatment in HIV/HCV co-infection as compared with HCV mono-infection.
- Consider referral to specialist.
- Drug-drug interactions between DAAs and cART require assessment.
- This population should be prioritised for treatment for both individual and population level benefit, given increasing liver-related morbidity and mortality in those with HIV/HCV co-infection and increasing HCV incidence in HIV-positive MSM.

HBV

- Screen all patients for evidence of current, or prior, HBV infection before starting treatment with DAAs (Hep B sAg, anti-Hep B core Ab, anti-Hep B sAb +/- HBV DNA).
- If diagnosis is chronic HBV (HepB sAg positive) or "occult" HBV infection (HepB sAg negative, anti-Hep B core Ab positive, HBV DNA detected), refer to specialist.
    1. Concurrent HBV nucleoside/nucleotide analogue therapy may be indicated.
    2. Monitor patients for HBV flare-ups or reactivation during treatment and post-treatment follow-up.
- Communicate MHRA/CHM advice that Direct-acting antiviral interferon-free regimens to treat chronic hepatitis C have a risk of hepatitis B reactivation (January 2017) to patient.
- Patients with HBV co-infection should be treated with the same DAA regimens, following the same rules as HCV mono-infected patients.

Mental health

- Discuss potential impact on adherence.
- Assess for drug-drug interactions.
- Multidisciplinary care should be considered.
- Assess social and financial situation.

Drug and alcohol use

- Integrated management of substance use, in combination with HCV care, as required.
- Multidisciplinary care should be considered.
- Discuss potential impact on adherence.
- Assess for drug-drug interactions, including illicit drugs.
- Encourage patient to moderate or abstain from alcohol use.
- Assess social and financial situation.
- Discuss harm reduction strategies.
- Advise about risk of reinfection with ongoing injecting following treatment.

Cardiac disease (patients on amiodarone)

Sofosbuvir is contra-indicated in patients receiving amiodarone. Life-threatening bradyarrhythmias have been reported.

Refer to specialist

Chronic renal disease

Mild to moderate renal impairment (CrCl 30 – 80 mL/min)

- Treat according to the general recommendations.
- No dose adjustments of HCV DAAs are needed.
- Monitor carefully.

Severe renal impairment or end-stage renal disease, including hemodialysis (CrCl <30 mL/min)

Refer to specialist

- Caution with use of ribavirin given increased risk of hemolytic anemia.

Glossary of Terms

90-90-90 targets: According to the United Nations Programme on HIV and AIDS (UNAIDS), by 2020, 90% of all people living with human immunodeficiency virus (HIV) will know their HIV status; 90% of all people with diagnosed HIV will receive sustained antiretroviral therapy (ART); and 90% of all people receiving ART will have viral load suppression.

Acquired Immunodeficiency Syndrome (AIDS): AIDS is a disease that can develop after HIV causes severe damage to the immune system, leaving the body vulnerable to life-threatening conditions, such as infections and cancers.

Adolescents: Unless otherwise noted, adolescents are individuals aged 10-19 years. Young adolescents are individuals aged 10-14 years; older adolescents are individuals aged 15-19 years.

Adults: Unless otherwise noted, adults are individuals aged 15-64 years.

Antiretroviral (ARV): A type of medication used to treat HIV.

Antiretroviral therapy (ART): Treatment with ARV drugs that inhibit the ability of HIV to multiply in the body, leading to improved health and survival among people living with HIV.

CD4+ T-Cells (CD4): CD4+ T-cells are white blood cells that are an essential part of the human immune system. These cells are often referred to as T-helper cells. HIV attacks and kills CD4 cells, leaving the body vulnerable to a wide range of infections. The CD4 count is used to determine the degree of weakness of the immune system from HIV infection.

Children: Unless otherwise noted, children are individuals aged 0-14 years.

***De facto* household resident:** A person who slept in the household the night prior to the survey.

***De jure* population:** Individuals who are usual residents of the household, irrespective of whether they slept in the household on the night prior to the household interview.

Emancipated minor: As defined by law in Nigeria, an individual less than aged 18 years who is married or is free from any legally competent representative.

Enumeration area (EA): A limited geographic area defined by the National Population Commission (NPopC), the national statistical authority and the NAIIS primary sampling unit.

Head of household: The person who is recognized within the household as being the head and is aged 18 years and older or is considered an emancipated minor.

Human Immunodeficiency Virus (HIV): HIV is the virus that causes AIDS. The virus is passed from person to person through blood, semen, vaginal fluids and breast milk. HIV attacks CD4 cells in the body, leaving a person living with HIV vulnerable to illnesses that a healthy immune system would have eliminated.

HIV incidence: A measure of the frequency with which new cases of HIV occur in a population over a time period. The denominator is the population at risk; the numerator is the number of new cases that occur during a given time period.

HIV prevalence: The proportion of persons in a population who are living with HIV at a specific point in time.

HIV viral load (VL): The concentration of HIV in the blood, usually expressed as copies per milliliter (mL).

HIV viral load suppression: An HIV VL of less than 1,000 copies per mL.

Household: A person or group of persons related or unrelated to each other who live in the same compound (fenced or unfenced), share the same cooking arrangements and have one person whom they identify as head of that household.

Informed consent: Informed consent is a legal condition whereby a person can give consent based upon a clear understanding of the facts, implications and future consequences of an action. In order to give informed consent, the individual concerned must have adequate reasoning faculties and be in possession of all relevant facts at the time he or she gives consent.

Male circumcision: Male circumcision is the removal of some or the entire foreskin (prepuce) from the penis. Medically supervised adult male circumcision is a scientifically proven method for reducing a man's risk of acquiring HIV through heterosexual intercourse.

Nigeria: The Federal Republic of Nigeria.

Prevention of mother-to-child HIV transmission (PMTCT): Mother-to-child HIV transmission (MTCT) is when an HIV-positive woman passes the HIV virus to her baby during pregnancy, labor or delivery or while breastfeeding. The United Nations recommends effective PMTCT to include a four-fold approach: (1) primary prevention of HIV infection among women of childbearing age; (2) preventing unintended pregnancies among women living with HIV; (3) preventing HIV transmission from women living with HIV to their infants; and (4) providing appropriate treatment, care and support to mothers living with HIV and their children and families.

Sexually transmitted infections (STIs): STIs are infections transmitted from person-to-person through sexual contact. They are sometimes called sexually transmitted diseases.

Tuberculosis: Tuberculosis (TB) is a contagious bacterial infection caused by Mycobacterium tuberculosis which mostly affects the lungs.

Young adults: Unless otherwise noted, individuals aged 20-24 years are defined as young adults.

Young people: Defined in this survey as the population of individuals aged 15-24 years (including older adolescents and young adults).

FOREWORD

The Nigeria HIV/AIDS Indicator and Impact Survey (NAIIS) 2018 is the largest HV population-based survey conducted globally with a sample size of 83,909 households and 383,574 individuals and coverage across 36 states (and the Federal Capital Territory). NAIIS determined the HIV incidence, HIV prevalence, viral load suppression and risk behaviours. For the first time, we have estimated national HIV incidence and viral load suppression and the prevalence of hepatitis B and C virus infections. NAIIS also enabled determination of the effectiveness and population-level impact of HIV-related prevention, care and treatment interventions implemented in the country, and our progress towards the achievement of the UNAIDS 90-90-90 targets.

The findings show steady improvements in reducing HIV prevalence, when compared to previous survey estimates. However, gaps remain in awareness of HIV status. The results also show varied HIV prevalence across states and highlights the need for more responsive approaches that take into consideration the situation of the epidemic in each state. The findings in relation to new HIV infections point us towards the need to increase our efforts in targeted testing at community-level, especially in areas with high HIV prevalence and low testing coverage.

While significant progress has been achieved in the overall coverage of ART for People Living With HIV and viral load suppression for those on ART, sustained efforts will be required, to maintain the gains and continue to decrease the risk of transmission of HIV.

One of the key lessons from the results of this survey is that we must continue to invest in addressing the important gender dimensions of access to HIV services, especially noting the difficulties women often experience in accessing health services.

NAIIS reiterates the importance of measuring progress in achieving epidemic control and strengthening capacity at country-level to collect and use surveillance data to inform and improve interventions as it relates to HIV and AIDS as well as Hepatitis B and C infections.

Overall, the results from NAIIS 2018 have provided Government and her partners with critical information to guide policy, programme and funding priorities and have bolstered the joint commitment to achieving epidemic control in Nigeria.

Dr. E. Osagie Ehanire *MD, FWACS*
Honourable Minister of Health

Executive Summary

Key Findings

- Approximately 8 new cases of HIV infection occur annually per 10,000 adults (those aged 15-64 years), with HIV incidence highest among women and men aged 25-34 years (Table 6.A).
- Overall, HIV prevalence among adults was 1.4%, with 1.8% in women and 1.0% in men (Table 7.A).
- Overall, HIV viral load suppression (VLS) prevalence among adults was 43.1%: 45.5% in women and 38.8% in men (Table 10.A).

UNAIDS 90-90-90 Targets

- **Diagnosed (antiretroviral (ARV)-adjusted awareness of HIV-positive status):** Based on self-report and ARV detection data, it is estimated that in Nigeria, 46.9% of persons living with HIV (PLHIV) aged 15-64 years were already aware of their HIV status (50.3% among women living with HIV and 40.9% among men living with HIV). This varied across age groups ranging from 31.0% among young people aged 15-24 years to 52.8% among adults aged 35-49 years (Table 11.B).
- **On treatment (ARV-adjusted treatment status):** Based on self-report and ARV detection data, it is estimated that among the PLHIV aged 15-64 years who were aware of their HIV status, 96.4% were receiving antiretroviral therapy (ART) (95.8% of women and 97.8% of men) (Table 11.B).
- **Viral load suppression (VLS):** Of the 96.4% of PLHIV aged 15-64 years on ART, based on self-report and ARV detection data, 80.9% had VLS, ranging from 75.2% among those aged 25-34 years (76.9% among women and 65.8% among men) to 82.0% among those aged 35-49 years (84.4% among women and 77.4% among men) (Table 11.B).

Other Key Findings

- In Nigeria, 3.1% of households had at least one HIV-positive member (3.3% in rural and 2.8% in urban households) (Table 4.D).
- Among heads of households, 1.9% of heads of households were HIV-positive (3.4% of female heads of households were HIV-positive compared to 1.3% of male heads of household) (Table 4.F).
- HIV prevalence among women of childbearing age (aged 15-49 years) who were pregnant at the time of the survey was 1.1% (Table 7.B).
- Overall, 30.1% of the adult population reported that they had ever tested for HIV and received their results, while 10.2% indicated that they had tested in the 12 months preceding the survey and received their results (Table 8.C).
- Concordance between self-report of ART and detection of ARVs was high among adults, with 94.5% of those who reported current ART use having detectable ARVs in blood. However, self-report of HIV status was less accurate, with detection of ARVs in blood among 24.4% of those who reported that they had not been previously diagnosed with HIV (Table 9.F).
- Among all HIV-positive adults aged 15-64 years, VLS ranged from 31.2% in those aged 20-24 years to 55.6% in those aged 50-54 years (Table 10.B).
- Among adult PLHIV who self-reported not to be aware of their HIV status and did not have detectable ARVs in their blood, 10% of women and 8.0% of men had severe immunosuppression, with a CD4 count less than 200 cells/microliter (µL) (Table 12.B).
- Among HIV-positive adults who reported initiating ART within the 12 months prior to the survey, 95.2% reported that they were still taking ART at the time of the survey. Among those who reported initiating ART more than 12 months prior to the survey, 94.3% reported that they were still taking ART at the time of the survey (Table 12.C, Table 12.D).

- Among women of childbearing age (aged 15-49 years) who delivered in the three years preceding the survey, 76.3% had at least one antenatal care (ANC) visit (Table 13.A).
- Among women who delivered within the 12 months preceding the survey, 41.5% reported knowing their HIV status (Table 13.C).
- Among HIV-positive women who delivered within the 3 years preceding the survey, 84.3% of those who knew their HIV status received ARVs (Table 13.D).
- Among older adolescents (aged 15-19 years) and young adults (aged 20-24 years), 18.1% reported having sexual intercourse before the age of 15 years (20.1% among women and 14.9% among men) (Table 14.A).
- Among early adolescents aged 10-14 years, 1.4% correctly responded to all questions that assessed knowledge of HIV transmission and prevention (1.2% of women and 1.7% of men) (Table 14.B, Table 14.C, Table 14.D).
- Incidence of HIV infection among older adolescents (aged 15-19 years) and young adults (aged 20-24 years) was estimated to be 0.04% (95% confidence interval (CI): 0.01%-0.07%) (Table 6.A).
- HIV prevalence was 0.2% among older adolescents (aged 15-19 years) (0.3% in women and 0.1% in men) and 0.8% among young adults (aged 20-24 years) (1.3% in women and 0.3% in men) (Table 7.C).
- Progress on 90-90-90 targets among older adolescents (aged 15-19 years) and young adults (aged 20-24 years): Based on self-report and detection of ARVs in blood, 31.0% of HIV-positive persons aged 15-24 years were aware of their HIV-positive status prior to the survey (31.7% of women and 28.8% of men). Among those who had been previously diagnosed, 92.3% were on ART. Among those on treatment, 77.1% had VLS (Table 11.B).
- Among adults aged 15 to 64 years who reported having sex in the last 12 months, 14.0% of women and 33.5% of men reported having sex with a non-marital, non-cohabitating partner. Of these adults, 35.3% (26.3% of women and 39.7% of men) reported using a condom during their last sexual intercourse with a non-marital, non-cohabitating partner (Table 15.B, Table 15.C, Table 15.D).
- The overall prevalence of hepatitis B virus (HBV) infection among adults aged 15-64 years was 8.1%, with 10.3% in men and 5.8% in women (Table 16.A).
- The overall prevalence of hepatitis C virus (HCV) infection among adults aged 15-64 years was 1.1%, with 1.3% in men and 1.0% in women (Table 16.B).
- Overall, 9.9% of adult PLHIV had ever visited a clinic for tuberculosis (TB) evaluation. Among adult PLHIV who had ever visited a TB clinic, 40.4% were diagnosed with TB. Of these, 98.8% completed TB treatment (Table 16.C).

Gaps and Unmet Needs

- While overall HIV prevalence determined by NAIIS was lower than reported in previous surveys and estimates, HIV continues to be transmitted in Nigeria.
- Awareness of HIV status is low, only 46.9% of PLHIV either self-reported awareness of their HIV status or had detectable ARVs in their blood. This low rate of awareness hinders the achievement of 90-90-90 targets.

Programmatic Responses or Recommendations

- To ensure 90-90-90 targets are met, the Government of Nigeria (GoN), supported by the U.S. President's Emergency Plan for AIDS Relief (PEPFAR) and The Global Fund to Fight AIDS, Tuberculosis and Malaria (GF), is implementing an ART Surge to identify PLHIV who do not know their status or are not in treatment and to provide effective treatment to help all persons reach VLS.
    - GoN is supporting an additional 100,000 PLHIV on treatment.
    - PEPFAR is supporting an additional 500,000 PLHIV on treatment.
    - GF is supporting an additional 110,000 PLHIV on treatment.
- States are helping to ensure efforts are successful by implementing policies that have been shown to improve access to services, including the removal of user fees for HIV-related services.

Conclusion

The results from NAIIS 2018 show varied HIV prevalence across states and underscore the need for effective approaches to addressing the epidemic, including targeted community-level testing efforts in areas with high HIV prevalence and low testing coverage.

In Nigeria, PLHIV on ART can achieve VLS, improving their lives and decreasing the risk of transmission of HIV. The results from NAIIS 2018 provide the Federal Ministry of Health (FMoH), the National Agency for the Control of AIDS, Nigeria (NACA) and their partners with critical information to reset the baseline data on HIV incidence and prevalence in Nigeria. The results have fostered cooperation and reinvigorated efforts across federal, state and international governments as well as donor and implementing organizations to halt the spread of HIV in Nigeria.

1. Introduction

1.1 Background

The Nigeria HIV/AIDS Indicator and Impact Survey (NAIIS) was a Population-based HIV Impact Assessment (PHIA) conducted to measure important national and regional HIV-related indicators, including progress toward the achievement of the UNAIDS 90-90-90 targets (UNAIDS, 2014) and to guide policy and funding priorities. PHIAs are part of a multi-country project funded by the United States President's Emergency Plan for AIDS Relief (PEPFAR) to conduct national HIV-focused surveys that describe the status of the HIV epidemic.

With a projected 2016 population of over 180 million and an estimated 3.2 million people infected with HIV, Nigeria is estimated to have the second largest number of people living with HIV (PLHIV) in the world[1] and is among the six nations facing the triple threat of high HIV burden, low treatment coverage and slow decline in new HIV infections.[2] At the end of 2015, Nigeria had over 1,078 facilities providing ART services and over 853,992 PLHIV who had initiated ART.[3] On average, an estimated 180,000 people die annually from AIDS-related illnesses and about 180,000 children aged 17 years or younger are currently orphaned by AIDS in Nigeria.[4]

NAIIS was led by the Government of Nigeria (GoN) under the Federal Ministry of Health (FMoH) and National Agency for the Control of AIDS (NACA). The survey was conducted with funding from PEPFAR and The Global Fund to Fight AIDS, Tuberculosis and Malaria (GF) with technical assistance from the U.S. Centers for Disease Control and Prevention (CDC). The survey was implemented by the NAIIS Consortium and led by the University of Maryland, Baltimore (UMB) under the supervision of the NAIIS Technical Committee.

1.2 Overview of NAIIS 2018

NAIIS, a household-based national survey, was conducted between July and December 2018 to assess the prevalence of HIV and related health indicators, including HBV and HCV infections. NAIIS offered home-based testing and counseling (HBTC) with return of results and collected information about households and individuals' background and the uptake of HIV care and treatment services. This survey is the first in Nigeria to estimate national HIV incidence and viral load suppression (VLS). The results provide information on national and regional progress toward control of the HIV epidemic. The survey also estimated the national prevalence of hepatitis B virus (HBV) infection, hepatitis C virus (HCV) infection, HBV/HIV co-infection and HCV/HIV co-infection.

Although previous HIV facility-based sentinel surveillance, population-based studies and programmatic data provided useful knowledge regarding Nigeria's HIV epidemic and HIV control efforts, current population-based information was critically needed to understand the current status of the epidemic and guide future interventions. NAIIS was designed to provide direct estimates of HIV infection risk and burden; the effectiveness and population-level impact of HIV-related prevention, care and treatment interventions implemented in the country; and Nigeria's progress toward the achievement of the UNAIDS 90-90-90 targets.

1.3 Specific Objectives

The goal of the survey was to estimate incidence and prevalence of HIV in Nigeria, to assess the coverage and impact of HIV services at the population level and to characterize HIV-related risk behaviors using a nationally representative sample of persons aged 15-64 years.

Primary Objectives

To estimate using a household-based, nationally representative sample of adults aged 15-64 years:

- National-level HIV incidence
- National- and state-level HIV prevalence
- National- and state-level prevalence of VLS; defined as HIV ribonucleic acid (RNA) less than 1,000 copies/mL of plasma

Secondary Objectives

To estimate among adults aged 15-64 years the:

- Prevalence of HIV-related risk behaviors, knowledge and attitudes
- Behavioral and demographic determinants of HIV incidence and prevalence
- National prevalence of HBV infection
- National prevalence of HCV infection
- Prevalence of HIV/HBV co-infection among HIV-positive individuals
- Prevalence of HIV/HCV co-infection among HIV-positive individuals

To estimate among the population of adults aged 15-64 and children aged 0-14 years the:

- Uptake of HIV-related services, especially prevention of mother-to-child HIV transmission (PMTCT)-related services and exposure to HIV interventions
- Distribution of CD4 T-cell counts among HIV-positive individuals

To estimate among children aged 0-14 years the:

- National paediatric HIV prevalence

2. Survey Design and Methodology

NAIIS was a nationally representative, cross-sectional, two-stage, population-based survey of households across Nigeria. The target population was children (aged 0-14 years) and adults (aged 15-64 years) living in the community. The survey population excluded military bases and institutionalized children and adults.

2.1 Study Area

Nigeria lies on the west coast of Africa between latitudes 4016' and 13053' north and longitudes 2040' and 14041' east. It occupies approximately 923,768 square kilometers of land stretching from the Gulf of Guinea on the Atlantic coast in the south to the fringes of the Sahara Desert in the north. The country's 2006 Population and Housing Census placed its population at 140,431,790. Nigeria is the most populous black nation in the world. Nigeria is comprised of 36 states and the Federal Capital Territory (FCT) (Figure 2.A) with 774 Local Government Areas (LGAs), categorized into six geopolitical zones (North West, North East, North Central, South West, South East and South South). Nigeria has more than 500 ethnic groups with the most populous being Hausa, Yoruba and Igbo.

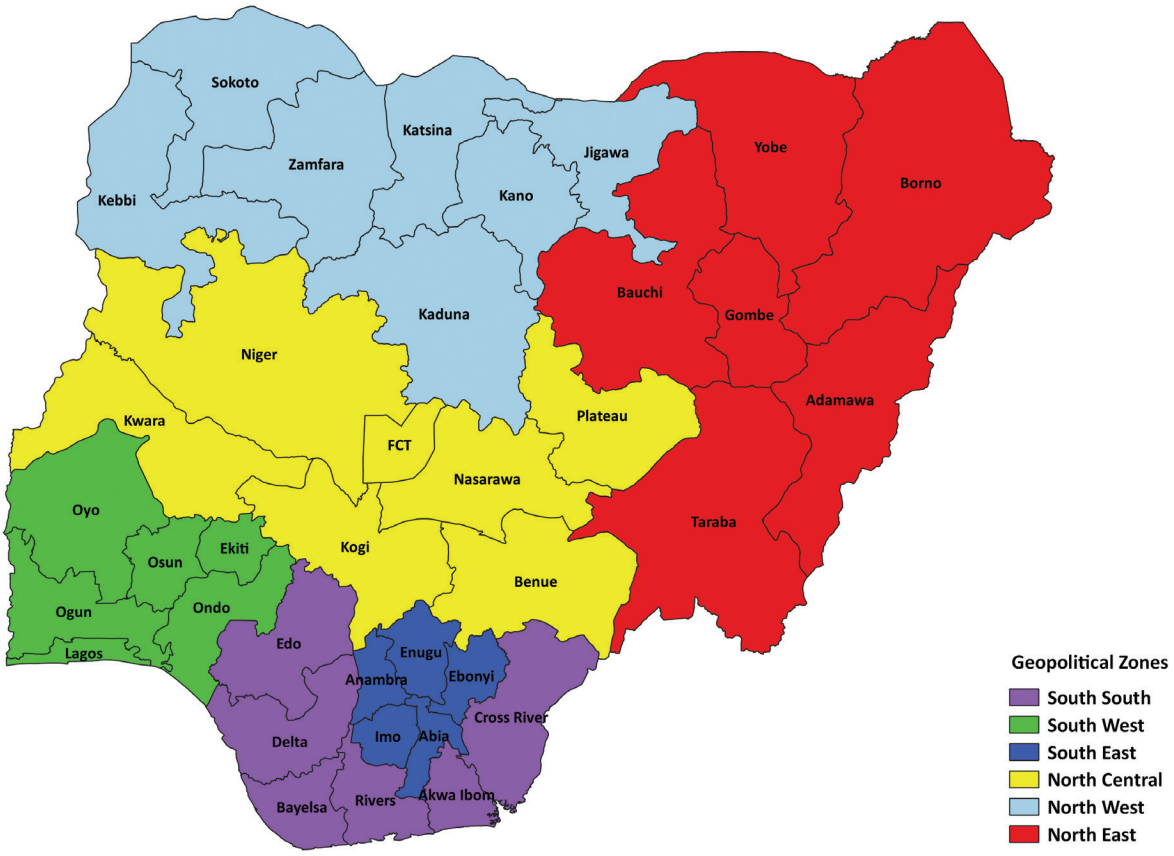

Figure 2.A The six geopolitical zones in Nigeria

2.2 Sampling Methods

NAIIS sampled the population using a two-stage cluster sampling technique, selecting enumeration areas (EAs) followed by households. The sampling frame consisted of 662,855 EAs, a total of 28,900,478 households and 140,431,798 persons based on the 2006 Census, with an average number of households and persons per EA of 44 and 212, respectively. The EAs were mutually exclusive (non-overlapping). This ensured that all households and residents had an equal chance of being included in the survey. Given the variability in household size across Nigeria (range of 4.0 to 5.7 individuals per household), state differences in household size based on the 2006 Census were considered when calculating the number of EAs or primary sampling units (PSUs) to be selected in each state.

The sample size was calculated to provide a representative national estimate of HIV incidence and HIV prevalence among adults aged 15-64 years with a relative standard error (RSE) less than or equal to 9% and 2%, respectively, as well as representative national and state estimates of VLS prevalence among PLHIV with 95% confidence intervals (CIs) between 10% and 15%. The sample size also was calculated to provide HIV prevalence estimates at the state level. One-quarter of the households were randomly selected for inclusion of children, which was designed to provide a representative national estimate of paediatric HIV prevalence with an RSE less than or equal to 0.1205%. The target sample size was 140,974 adults and 31,629 children, for an overall total of 172,603 adults and children.

The first stage of sampling selected 4,035 EAs using a probability proportional to size method. The 4,035 EAs were stratified by Nigeria's 36 states and the FCT. An equal-size approach was proposed with an estimated sample size of 3,700 blood specimens from each state. This number of blood specimens was sufficiently large to obtain robust estimates of HIV prevalence for the population and VLS among HIV-positive individuals in most states. The second stage selected a random sample of households within each EA using an equal probability method. The number of households selected per cluster was 28.

At the request of Lagos State, the NAIIS sample design was adjusted to oversample Lagos State to obtain stable estimates of HIV prevalence in 20 LGAs. The sample of 2,900 responding households with an anticipated 3,677 blood draws among adults aged 15-64 years was increased to a sample of 4,800 responding households with an estimated 6,087 blood draws among adults aged 15-64 years. Lagos State was the only state with a change in the sample design. The evaluation of this "equal-size" approach to the 37 strata, with the larger sample for Lagos State, is presented in Table 2.A.

Table 2.A Distribution of sampled enumeration areas and households by state

State	Total clusters sampled for the survey	Number of households sampled for the survey	Number of households sampled for inclusion of children aged 0-14 years	Number of households sampled for hepatitis B and C tests

2.3 Eligibility Criteria, Recruitment and Consent Procedures

The eligible survey population included:

- Adults aged 18-64 years and emancipated minors aged 15-17 years living in the selected households and adult visitors who slept in the selected household the night before the survey who were willing and able to provide written consent.
- Children and adolescents aged 10-17 years living in the selected households and visitors in the same age bracket who slept in the selected household the night before the survey who were willing and able to provide written assent and whose parents or guardians were willing and able to provide written permission for their participation.
- Children aged <10 years living in the selected households and child visitors in the same age bracket who slept in the selected household the night before the survey whose parents or guardians were willing and able to provide written consent for their participation.

Interviewers used tablets with an electronic informed consent form to collect consents from potential survey participants (Appendix H). All potential participants were given a printed copy of the consent form in either English, Hausa, Igbo or Yoruba, depending on their preference. Consent was recorded by signing or making a mark on the consent form on the tablet and on a printed copy retained by the participant. Consent processes were conducted in different stages. Written consent to participate in the survey was obtained from the identified household head, after which individual members were rostered during the household interview. Emancipated minors (aged 15-17 years) and adults provided written consent on the tablet separately for the interview and for participation in biomarker testing which included HBTC, return of rapid HIV test results, linkage to care (for identified positives) and CD4 counts during household visits. Receipt of test results was a requirement for participation in the biomarker component. If a participant did not want to receive his or her HIV test result, it was considered a refusal and the survey was concluded. Adults were also asked for written consent to store their blood specimens in a repository to perform additional tests in the future. Individuals with disabilities who were otherwise able to give written consent or provide a mark were offered survey participation. Procedures with illiterate participants or participants with a sight disability involved the use of an impartial witness, chosen by the potential participant, who also signed or made a mark on the consent form on the tablet and on the printed copy. If no witness could be identified, the potential participant or household, if the head of household was sight disabled or illiterate, was considered ineligible. Individuals who were unable to give consent due to cognitive impairment or intellectual disability were considered ineligible to participate.

Children aged 10-17 years were asked for assent to the interview and biomarker components after permission was granted by their parents or guardians. For minors below the age of assent (<10 years), consent was obtained from their parents or guardians for biomarker testing. In both cases, when a parent or guardian refused receipt of the child's HIV test result, it was considered a refusal and the survey was concluded.

2.4 Survey Implementation

Training of Field and Laboratory Staff

Survey staff received training on all contents of the data collection instruments, tablet use, standard operating procedures (SOPs) and manuals. The training curriculum included:

- Survey objectives
- Advocacy, communication and social mobilization
- Survey design and methods
- Completion of survey forms
- Data collection

- Communication skills
- Staff responsibilities
- Recruitment of participants
- Informed consent procedures
- Ethical guidelines for research including participants' rights, privacy and confidentiality
- Blood collection for children and adults, including venipuncture and finger/heel stick
- Home-based HIV testing, HBV and HCV testing and counseling
- CD4 count measurement using point-of-care (POC) Pima™ Analyzer
- Biosafety
- Referral of participants to health and social services
- Referrals for adverse events
- Safety procedures in the field
- Protocol deviations, adverse events and reporting of events
- Management and transportation of blood specimens

All laboratory staff were trained in specimen management, including specimen processing, labeling and quality assurance (QA). Central laboratory staff were trained in VL measurement, early infant diagnosis (EID), HIV confirmatory testing and HIV recency testing using the Limiting Antigen (LAg) Avidity enzyme immunoassay (EIA).

Survey Staff

Fieldwork was conducted by 1,935 field staff composed of 190 team leaders, 380 interviewers, 380 counselors, 380 drivers, 190 community trackers and 415 field laboratorians. Field teams included a team lead, a tracker, two interviewers, two counselors, two field laboratory technicians and two drivers. All teams consisted of male and female staff who spoke the languages used in the study areas to which they were deployed. The field teams were supervised by a director and field implementation was supported by five zonal technical advisors. Three of these five technical advisors oversaw two zones each. Other technical advisors included the HIV Linkage to Care Lead and the National Linkage to Care Advisor. NAIIS staff included 14 field coordinators managed by a central staff team, who guided and oversaw data collection activities, performed quality checks and provided technical support (Appendix D).

In addition, the laboratory staff were organized at different levels (two senior technical lab advisors, four technical lab advisors, 12 zonal and sub-zonal lab coordinators and 18 lab logisticians). A total of 105 satellite laboratory technicians and 10 central lab specialists processed specimens and performed additional procedures for HIV-1 VL, infant virologic HIV testing (IVT)/EID, quality control (QC) and QA.

Pilot Survey

After training all field teams, a pilot was conducted, including informed consent, data collection and management, HIV testing and counseling and laboratory activities in 191 EAs with 25 households per EA of the sampling frame, a total of 4,775 households. Participants in the pilot were informed that they were participating in a pilot. Data collected from these households were not included in the survey. Information gathered from the pilot survey was used to modify survey collection instruments and field procedures. All changes in the questionnaire after the pilot were agreed upon by the FMoH/NACA in consultation with stakeholders and approved by the appropriate institutional review boards (IRBs).

Community Sensitization and Mobilization

Prior to data collection, community sensitization and mobilization were conducted to maximize community support and participation in the survey. Advocacy, communication, sensitization and mobilization activities began four months before fieldwork commenced with a high-level national launch meeting that included key national and regional leaders, mass media and other stakeholders. Activities leveraged existing structures conducted by the state and local government-based mobilization teams in each EA prior to data collection to facilitate ownership of the survey. The mobilization teams held community sensitization meetings, dialogues and rallies; distributed printed information, education and communication materials such as posters, leaflets, flyers and brochures; and conducted house-to-house interpersonal communications with selected households and other community residents. Community mobilization data were captured using paper-based data collection tools and entered into Encuesta, an electronic data collection application.

Supervision

Field supervisors provided ongoing supervision throughout NAIIS field implementation. Field supervisors supported teams by organizing supplies ensured transport of blood specimens, coordinated community-mobilization efforts, provided technical troubleshooting and checked the quality of household procedures and data collected. During monitoring visits, daily monitoring forms were used for household and individual outcome tracking and verifying completeness of interviews. Household revisits were used to verify results. Assessment of the quality of survey procedures, including adherence to protocol and standard operating procedures (SOPs) and identification of challenges, resolutions and responses to challenges with data collection, was also observed by the monitoring teams. Regular debriefing sessions were held between field-based supervisors and monitoring teams. External monitoring teams, including GoN staff, Orphan Reach (formerly QED Clinical Services), state implementation teams and international monitors, periodically (bi-monthly and monthly) observed data collection activities in the field and laboratories to ensure quality and provide technical support, quality checks and controls. Monitoring reports were circulated to collaborating institutions and the NAIIS Technical Committee. As necessary, survey practices were amended to respond to problems identified during monitoring.

Electronic Monitoring System

The Activity Information Management System (AIMS) was used to monitor survey progress. Assignment and tracking of devices to staff was managed by the AIMS inventory module. The AIMS dashboard provided a daily comprehensive overview of the data uploaded into the NAIIS server, e.g., data collection coverage, EA completion status, sampled households, household and eligible household member response rates, biomarkers and overall progress towards the achievement of the target sample. Field data quality was reviewed by 30 data monitors who utilized Voice Over Internet Protocol systems to interact with the field teams and correct identified errors. The data monitors were situated at the central office.

Survey Instrument and Procedure for Data Collection

Survey instruments comprised of questionnaires and laboratory forms were built into a Computer Assisted Personal Interviewing (CAPI) system where the interviewer uses a tablet to administer and record the interview responses. NAIIS interview staff used Android tablets with Census and Survey Processing System (CSPro) software. All tablets were encrypted and password-protected to ensure confidentiality. The questionnaires were translated into the three major Nigerian languages, Hausa, Igbo and Yoruba. The questionnaire was administered in English and the three major Nigerian languages. Household, individual interview, counseling and field laboratory data were recorded using CAPI. The household questionnaire included modules on head of household eligibility; household schedule, including orphan status; and household characteristics (Appendix E). The individual adult questionnaire was administered to participants aged 15-64 years and included modules on socio-demographic characteristics; marriage; reproduction; children; male circumcision (men only); sexual activity; HIV testing; HIV status, care and treatment; tuberculosis and other health issues; and gender norms (Appendix F). Participants who self-reported their HIV-positive status were asked questions about their HIV care experiences. Parents or guardians responded to questions on their children's (aged 0-14 years) health, participation in HBTC services and, if the child was reported to have and HIV-positive status, their child's HIV care experiences as a part of the adult interview. The individual adolescent questionnaire was administered to participants aged 10-14 years and included modules on socio-demographic characteristics; parental support; alcohol and drugs; condoms; sexual behaviors; HIV knowledge; HIV risk perception; HIV testing; HIV stigma; and social norms, intention to abstain, self-efficacy and assertiveness (Appendix G).

2.5 Laboratory

A detailed description of the NAIIS laboratory methodology is available in Appendix B of this report.

All field test results were returned to participants the same day as the survey interview. All participants, whether HIV-positive or HIV-negative, received two copies of the written test results. Identified HIV-positive participants were referred to health facilities of their choice that offered HIV care and treatment services. Emancipated minors received their results directly. For children aged 10-17 years, results were received by the parents or guardians with the child present, only after receiving parental or guardian permission and child assent. Test results for children aged 0-9 years were disclosed and returned to parents or guardians.

Satellite, Mobile and Central Laboratories

A total of 94 satellite laboratories were activated to support NAIIS. Three mobile laboratories supported areas with security challenges or difficult topography. The EAs were mapped and linked to specific satellite and mobile laboratories based on proximity. The Nigeria Centre for Disease Control (NCDC) National Reference Laboratory (NRL) was designated as the central reference laboratory and biorepository for the survey. Trained lab specialists at each satellite and mobile laboratory performed HIV confirmatory tests, conducted QA tests and processed whole blood specimens into plasma aliquots and dried blood spot (DBS) cards for temporary storage at -20°C. HIV rapid test QA was conducted on the first 50 specimens tested by each field laboratory technician. All HIV-positive specimens, whether identified in the field or during QA, underwent confirmatory testing using the Geenius™ HIV 1/2 Supplemental Assay (Bio-Rad, Hercules, California, United States). A positive Geenius™ HIV 1/2 result defined an HIV positive test result for the survey. Specimens that were HIV positive from the HBTC and HIV negative on Geenius™ HIV 1/2 were retested using Western blot and Total Nucleic Acid (TNA) PCR. Central laboratory procedures included HIV VL testing, HIV TNA PCR for infant virologic testing and for confirmation of status of those who self-reported an HIV-positive status but tested HIV negative in HBTC, HIV recency testing, HIV drug resistance testing and long-term storage of specimens at -80°C.

The survey conducted household revisits for investigation of discrepancies between the results of tests in the field and in the laboratory. The specimens collected during the revisit underwent comprehensive retesting in the laboratory. For each case, an analysis of the nature of the discrepancy and potential sources of error was performed to determine the definitive HIV status for the participant and for analysis.

2.6 Data Processing and Analysis

During the household data collection, questionnaire and laboratory data were transmitted between tablets via Bluetooth connection. This facilitated synchronization of household rosters and ensured data collection for each participant followed the correct pathway. All field data collected in CSPro and the Laboratory Data Management System (LDMS) were transmitted to a central server using File Transfer Protocol Secure (FTPS) over a 4G or 3G telecommunication provider at least once a day. Questionnaire data cleaning was conducted using CSPro and SAS 9.4 (SAS Institute Inc., Cary, North Carolina, United States). Laboratory data were cleaned and merged with the final questionnaire database using unique specimen barcodes and study identification numbers.

All results presented in the technical report were based on weighted estimates unless otherwise stated. Analysis weights accounted for sample selection probabilities and adjusted for nonresponse and noncoverage. Nonresponse adjusted weights were calculated for households, individual interviews and individual blood draws in a hierarchical form. Adjustment for nonresponse for initial individual and blood-level weights was based on the development of weighting adjustment cells defined by a combination of variables that were potential predictors of response and HIV status. The nonresponse adjustment cells were constructed using the Chi-square Automatic Interaction Detector (CHAID) algorithm. The cells were defined based on data from the household interview for the adjustment of individual-level weights and from both the household and individual interviews for the adjustment of blood specimen-level weights. Post-stratification adjustments were implemented to compensate for non-coverage in the sampling process. This final adjustment calibrated the nonresponse-adjusted individual and blood weights to make the sum of each set of weights conform to national population totals by sex and five-year age groups.

Descriptive analyses of response rates, characteristics of respondents, HIV prevalence, CD4 count distribution, HIV testing, self-reported HIV status, self-reported ART, VLS, PMTCT indicators, HBV, HCV and sexual behavior were conducted using SAS 9.4.

Incidence estimates were based on the number of HIV infections identified as recent with the HIV-1 LAg Avidity plus VL algorithm and ARV algorithm and obtained using the formula recommended by the WHO Incidence Working Group and Consortium for Evaluation and Performance of Incidence Assays and with assay performance characteristics of a mean duration of recent infection (MDRI) = 130 days (95% CI: 118, 142), a time cutoff (T) = 1.0 year and percentage false recent (PFR) = 0.00.

2.7 Ethical Considerations

All survey procedures were aligned with recommendations from the ethics and regulatory board. Human subject review was conducted by the CDC IRB, the UMB IRB and the Nigerian National Health Research Ethics Committee.

Informed Consent

The informed consent/assent read to potential participants contained all information required to make an informed decision as to whether to participate, including all elements of informed consent as required by United States 45 Code of Federal Regulations (CFR) 46.116 and 21 CFR 50.25(a)(b). Consent forms (Appendix H) were used for household interviews of adults aged 18-64 years and individual interviews and blood draw for individuals aged 18-64 years. Parental/guardian permission forms were used for interviews and blood draw of minors aged 10-17 years prior to individual assent. Assent forms were used for interviews and biomarkers for minors aged 10-17 years. Parental/guardian permission forms were used for blood draw for minors aged 0-9 years.

3. Response Rate

3.1 Background

Household response rates were calculated using the American Association for Public Opinion Research Response Rate 4 method[1] as the number of complete and incomplete household interviews among all eligible households, and those estimated to be eligible among those with unknown eligibility (households not located, not attempted or unreachable). Vacant and destroyed households, nonresidential units and household units with no eligible respondents were considered not eligible and excluded from the calculation.

Individual interview response rates were calculated as the number of individuals interviewed divided by the number of individuals eligible to participate in the survey. Blood draw response rates for adults were calculated as the number of adults who provided a blood specimen divided by the number of adults who were interviewed. Blood draw response rates for children were calculated as the number of children who provided a blood specimen divided by the number of children eligible to participate in the survey.

3.2 Results

Tables 3.A and 3.B describe the household, individual interview and blood draw response rates.

3.2.1 Key Findings

- A total of 101,267 households were selected, 89,345 were occupied and 83,909 completed the household interview (Table 3.A).
- For adults aged 15-64 years, interview response rate was 91.6% for women and 88.2% for men; blood draw response rate was 92.9% for women and 93.6% for men (Table 3.B).
- For adolescents aged 10-14 years, interview response rate was 86.8% for women and 86.2% for men; blood draw response rate was 91.2% for women and 92.3% for men (Table 3.B).
- For children aged 0-9 years, blood draw response rate was 68.5% for women and men (Table 3.B).

Blood draw response rate[2]	92.9	92.4	94.0	93.3	93.6	92.9

[1]Interview response rate – number of individuals interviewed/number of eligible individuals.
[2]Blood draw response rate – number of individuals who provided blood/number of individuals interviewed.

4. Survey Household Characteristics

4.1 Background

Household compositions are described in terms of sex of the head of household and size of the household. The age structure of the *de facto* household population (i.e., persons who slept in the household the night before) is described by sex as well as urban/rural residence.

4.2 Household Composition

NAIIS documented 83,909 heads of households for all states (Table 4.A). Approximately 57% of the surveyed households resided in rural areas.

4.3 Results

The NAIIS households' characteristics and distributions are detailed in Tables 4.A to 4.F and Figures 4.A to 4.E.

4.3.1 Key Findings

- Among the *de facto* household population, 47.9% were men and 52.1% were women (Table 4.B).
- Nationally, 29.4% of heads of household were women and 70.6% were men. Among heads of households, 3.4% of female heads of households were HIV-positive compared to 1.3% of male heads of household (Table 4.A, Table 4.F).
- Among all households, 3.1% had at least one HIV-positive member. Of households with at least one HIV-positive member, 87.9% had one HIV-positive member and 11.2% had two HIV-positive members (Table 4.D, Table 4.E).

5. Survey Respondent Characteristics

5.1 Background

This chapter summarizes the basic demographic and socioeconomic characteristics of survey respondents (children (aged ≤14 years), adolescents (aged 10-14 years) and adults (aged 15-64 years). The key indicators in this report are stratified according to these characteristics.

5.2 Demographic Characteristics of the Adult Population

The distribution of the adult population showed a variation between rural (51.8%) and urban (48.2%) dwellers but no variation by sex (Table 5.A).

5.3 Results

Tables 5.A to 5.C present the demographic characteristics of NAIIS respondents.

5.3.1 Key Findings

- Among adult respondents, 87.3% were aged 15-49 years (Table 5.A).
- Among children, 35.5% were aged 5-9 years (Table 5.B).
- Among adult respondents, 57.5% were either married or living together with a higher proportion among women (64.1%) than men (51.2%) (Table 5.A).
- Among adult respondents, 41.8% attained secondary education while 18.0% had no education (Table 5.A).

6. HIV Incidence

6.1 Background

HIV incidence, the measure of new HIV infections in a population over time, provides important information on the status of the HIV epidemic. HIV incidence can be used for effective targeted HIV prevention planning in groups that are most vulnerable to recent HIV infection and to measure the impact of HIV prevention interventions. For the purposes of this analysis, HIV incidence among adults aged 15-64 years is expressed as the cumulative incidence or risk of new infections in a 12-month period, a close approximation to the instantaneous incidence rate (Appendix B). NAIIS was not powered to estimate incidence at the sub-national level or across sub-groups.

6.2 Results

Tables 6.A and 6.B present HIV incidence in Nigeria at the time of the survey.

6.2.1 Key Findings

- The annual incidence of HIV among adults aged 15-64 years was 0.08% (women 0.12%, men 0.05%). This corresponds to 8 new infections per 10,000 persons per year (Table 6.A).
- Annual HIV incidence peaked at 0.22% among women aged 25-34 years and at 0.10% among men in the same age group (Table 6.A).

Table 6.A Annual HIV incidence using LAg/VL[1] testing algorithm

7. HIV Prevalence

7.1 Background

This chapter presents representative estimates of HIV prevalence among adults aged 15-64 years at the national and state level by selected demographic and behavioral characteristics. HIV prevalence testing was conducted in each household using a serological rapid diagnostic testing algorithm based on Nigeria's National HIV Testing Guidelines, with laboratory confirmation of seropositive specimens using a supplemental assay. Appendix A describes the sample design and Appendix B describes the NAIIS HIV testing methodology. Appendix C provides estimates of sampling errors.

7.2 Results

Tables 7.A to 7.C and Figures 7.A to 7.D present HIV prevalence data from the survey.

7.2.1 Key Findings

- HIV prevalence among adults aged 15-64 years was 1.4%. This was lower among men (1.0%) than women (1.8%) and lower in urban (1.3%) areas than in rural (1.5%) areas (Table 7.A).
- HIV prevalence among adults aged 15-49 years was 1.3%. This was lower among men (0.8%) than women (1.7%) and lower in urban (1.1%) than in rural (1.4%) areas (Table 7.B).
- Among adults aged 15-49 years, Akwa Ibom State had the highest HIV prevalence (4.8%) followed by Benue State (4.3%) and Rivers State (3.6%) (Table 7.B).
- Among adults aged 15-49 years, Jigawa and Katsina States had the lowest prevalence at 0.3% each (Table 7.B).

8. Self-Reported HIV Testing

8.1 Background

HIV testing is necessary for awareness of HIV status and is a critical component of HIV epidemic control. Awareness of HIV-positive status is the first step to engagement with HIV care and treatment services, accessing ART, prevention counseling for HIV-positive and HIV-negative individuals to reduce risk of HIV transmission or acquisition and access to screening services for other co-morbidities.

8.2 Results

Tables 8.A to 8.C and Figure 8.A show the results of receipt of HIV test results ever and in the last 12 months.

8.2.1 Key Findings

- Among adults aged 15-64 years, 30.1% self-reported ever having received HIV test results (32.6% among women and 27.7% among men) (Tables 8.A, 8.B and 8.C).
- Among adults aged 15-64 years, 36.8% in urban areas self-reported ever having received HIV test results compared to 23.8% in rural areas (Table 8.C).

Table 8.A Self-reported HIV testing: Men

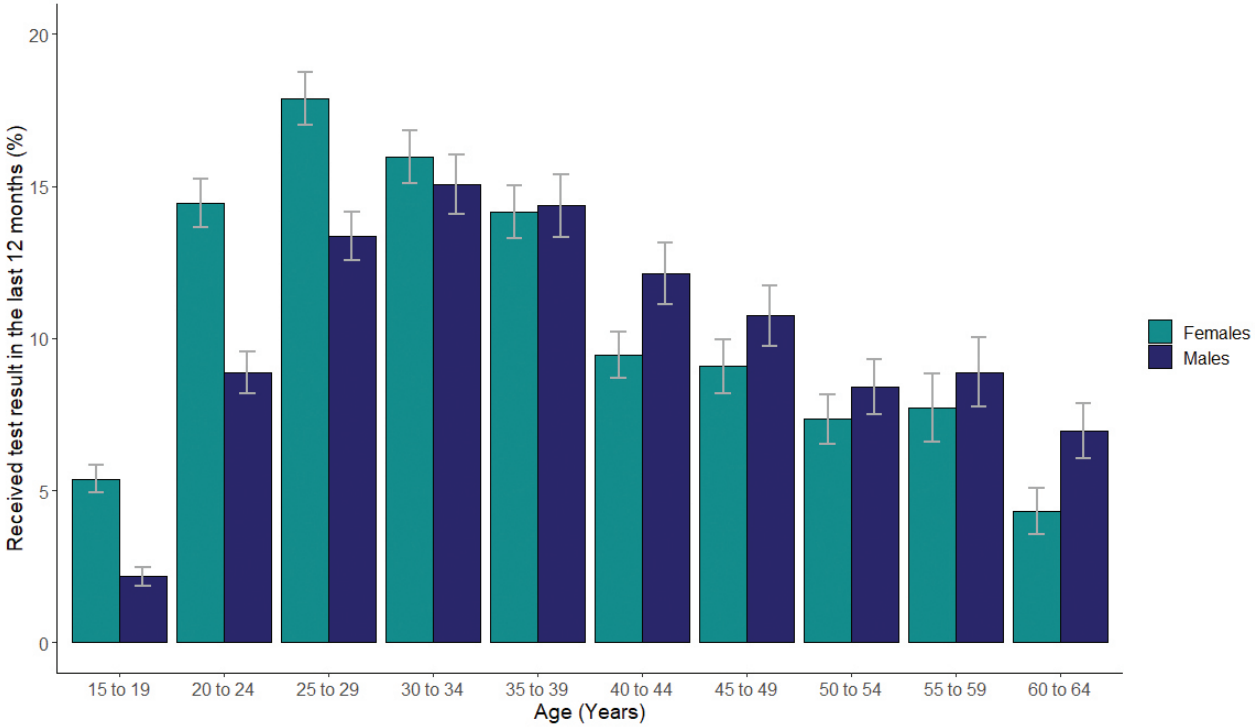

Figure 8.A Proportion of adults aged 15-64 years who self-report receiving HIV test results in the last 12 months by sex and age, NAIIS 2018

9. HIV Diagnosis and Treatment

9.1 Background

Recent studies have proven that treating PLHIV at higher CD4 counts improves immune recovery, decreases the incidence of non-AIDS events and comorbidities and mortality and reduces sexual and vertical transmission. In 2016, after an extensive review of evidence of both the clinical and population-level benefits of expanding ART, WHO changed its recommendation to support a policy of "Treatment for All," regardless of CD4 count.[1,2] In Nigeria, the "test and treat" policy was adopted in December 2016. NAIIS determined the presence of four ARVs (efavirenz, lopinavir, nevirapine and atazanavir) in blood as markers of the first- and second-line regimens prescribed in Nigeria at the time of the survey.

9.2 Results

Tables 9.A to 9.F and Figure 9.A describe ART uptake in Nigeria during NAIIS.

9.2.1 Key Findings

- Among HIV- positive adults aged 15-64 years, 71.1% self-reported being unaware of their HIV status (Table 9.C).
- Of HIV- positive adults aged 15-64 years, 25.9% reported being on ART (Table 9.C).
- The percentage of HIV- positive adults aged 15-64 years unaware of their HIV status was higher in rural areas (74.0%) than urban areas (67.4%) (Table 9.C).
- Among individuals who self-reported an HIV- positive status and being on ART, 94.5% had ARVs detected in their blood. Among those who self-reported an HIV- positive status and not being on ART, 42.0% had ARVs detected in their blood (Table 9.F).
- Among those who self-reported not being previously diagnosed, 24.4% had ARVs detected in their blood (Table 9.F).

[1]Antiretroviral detection assay included only atazanavir, efavirenz and lopinavir. Participants who reported antiretroviral therapy use or had an undetectable viral load but had no evidence of the first three ARVs were tested for nevirapine as well.
[2]ART – antiretroviral therapy.

10. Viral Load Suppression

10.1 Background

The key treatment success indicator for PLHIV is VLS. For NAIIS, VLS was defined as VL less than 1,000 HIV RNA copies per mL of plasma. This chapter describes VLS among the population of HIV-positive adults by socio-demographic characteristics.

10.2 Results

Tables 10.A and 10.B, along with Figures 10.A to 10.D, present VLS data of PLHIV.

10.2.1 Key Findings

- Among adults aged 15-64 years who tested HIV positive, 43.1% had VLS (women 45.5%, men 38.8%). The prevalence of VLS was lower in rural than urban areas (40.3% and 46.7%, respectively) (Table 10.A).
- Among adults previously diagnosed and self-reported on ART, VLS was 82.5% (Table 10.A).
- VLS was lowest among those never married (31.6%) and highest in those who that were widowed (52.9%) (Table 10.A).
- VLS was highest among adults in the North Central Zone (63.8%) and lowest among adults in the South South Zone (31.1%) (Table 10.A).
- VLS varied by age group, ranging from 31.2% among adults aged 20-24 years to 55.6% among adults aged 50-54 years (Table 10.B).

Table 10.A Viral load suppression prevalence by demographic characteristics

Percentage distribution of HIV-positive persons aged 15-64 years with viral load suppression (VLS) (<1,000 copies/mL)[1] by sex, self-reported HIV diagnosis, antiretroviral therapy (ART) status and selected socio-demographic characteristics, NAIIS 2018

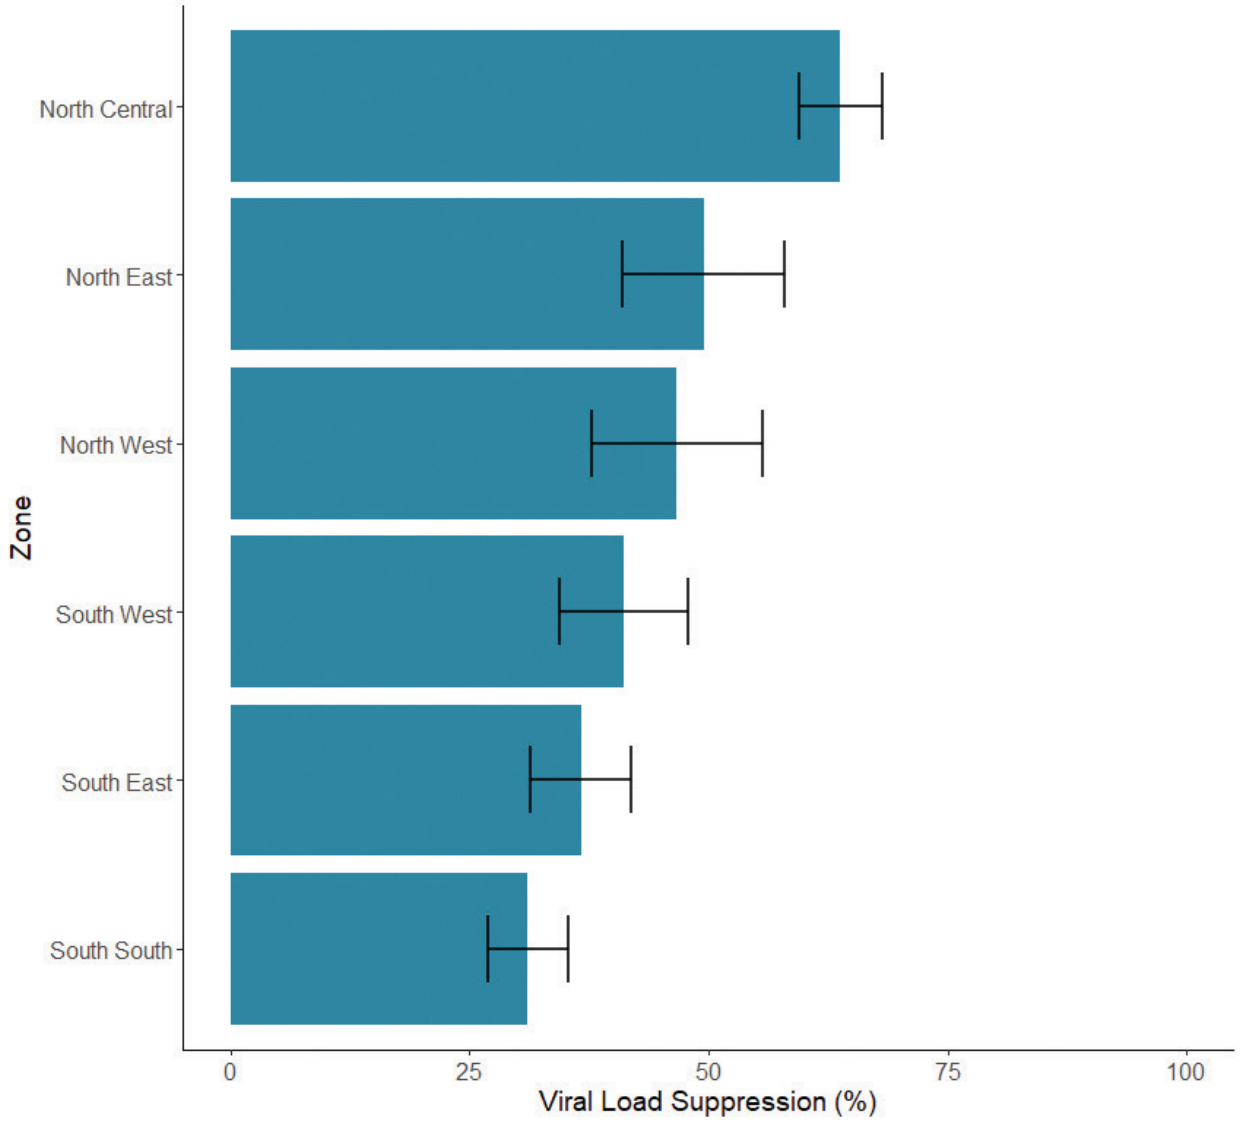

Figure 10.C Viral load suppression (<1000, copies/mL) among HIV-positive adults aged 15-64 years by geopolitical zone, NAIIS 2018

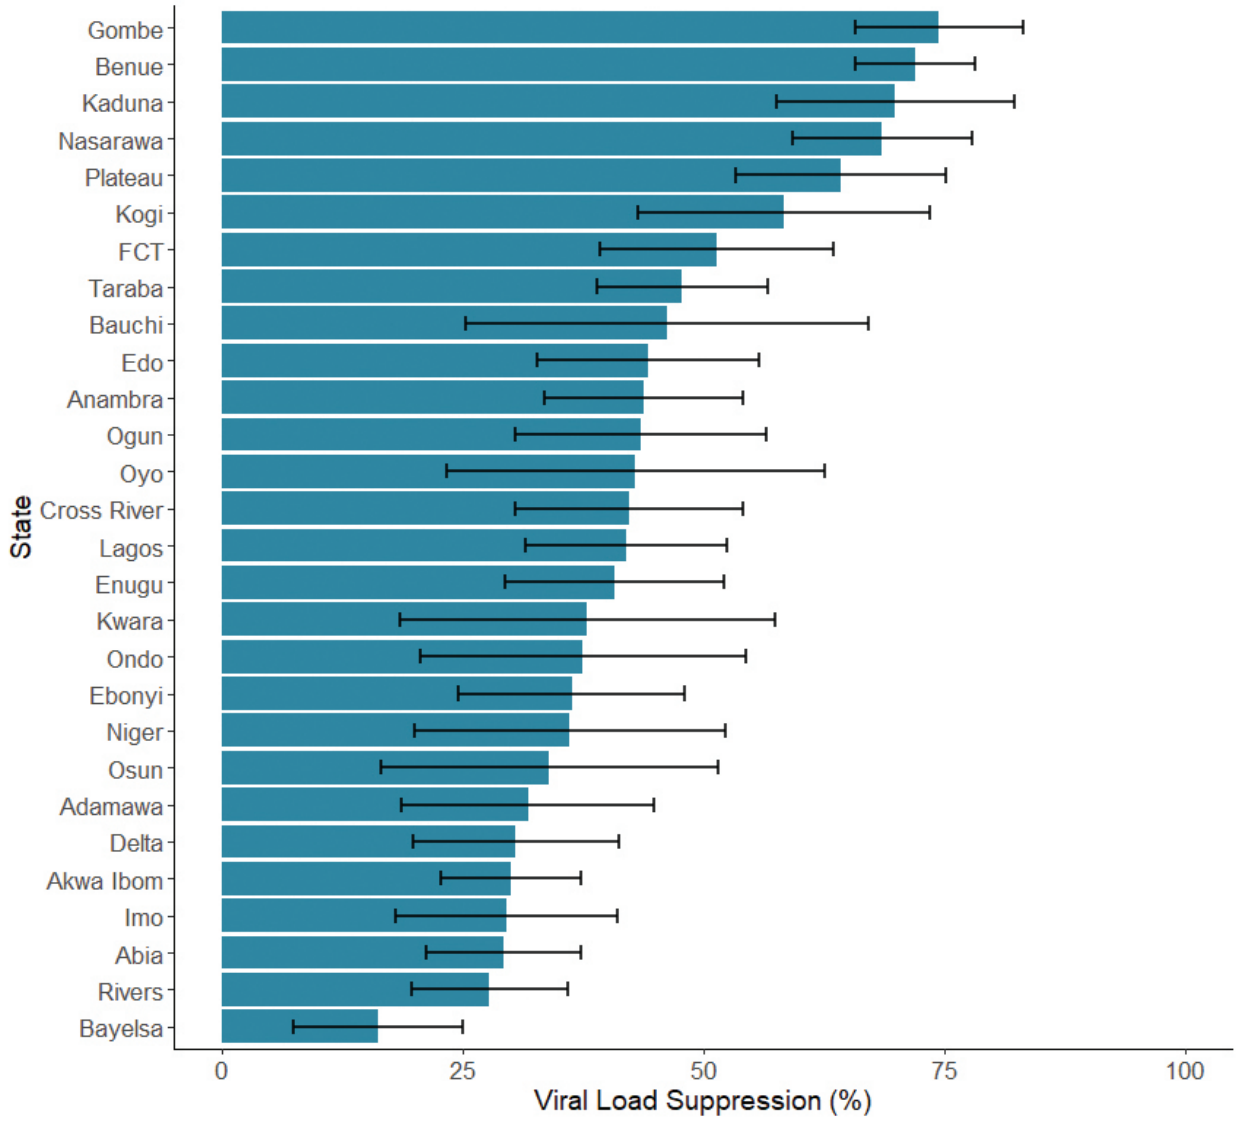

Figure 10.D Viral load suppression among HIV-positive adults aged 15-64 years by state, NAIIS 2018
The estimates were not presented for states where the unweighted sample size was 30 or less people.

11. UNAIDS 90-90-90 Targets

11.1 Background

UNAIDS set ambitious targets referred to as 90-90-90 to bring the HIV epidemic under control. The 90-90-90 targets propose that by 2020, 90% of all PLHIV will know their HIV status; 90% of all persons diagnosed with HIV will receive sustained ART; and 90% of all persons receiving ART will have VLS.[1] Awareness of HIV-positive status and treatment status among PLHIV who know their HIV-positive status are indicators of access to services. VLS among individuals who know their HIV status and are on treatment provides a marker of access to and retention in care and a measure of program success. VLS of 73% (90 x 90 x 90) or greater among all PLHIV is an indication of successful testing and treatment services.

The 90-90-90 results are presented first as self-report and second as verified by ARV biomarker data. In the first case, participants were defined as 'aware' of their HIV-positive status if they self-reported knowing they were HIV positive before NAIIS HIV testing and 'on treatment' if they self-reported ART use. In the second case, self-reported 'aware' and 'on treatment' have been adjusted to include participants with ARV biomarkers detected in their blood specimen as aware' and 'on treatment' even when they did not self-report. In both sets of results, individuals who had achieved VLS but were not aware of their HIV-positive status or were not on ARVs, either by self-report or ARV biomarker data, were excluded from the numerator for the third 90.

11.2 Results

Tables 11.A to 11.C, along with Figure 11.A, show progress towards attaining the 90-90-90 targets in adults at the time of NAIIS.

11.2.1 Key Findings

- Diagnosed: Among HIV-positive adults aged 15-64 years, 46.9% self-reported knowing their HIV status or had detectable ARVs in their blood (40.9% of men and 50.3% of women) (Table 11.B).
- On Treatment: Among HIV-positive adults aged 15-64 years who knew their HIV status, 96.4% self-reported being on ART or had detectable ARVs (97.8% of men and 95.8% of women) (Table 11.B).
- Suppressed Viral Load: Among HIV-positive adults aged 15-64 years who self-reported being on ART or had detectable ARVs, 80.9% had VLS (79.2% of men and 81.7% of women) (Table 11.B).

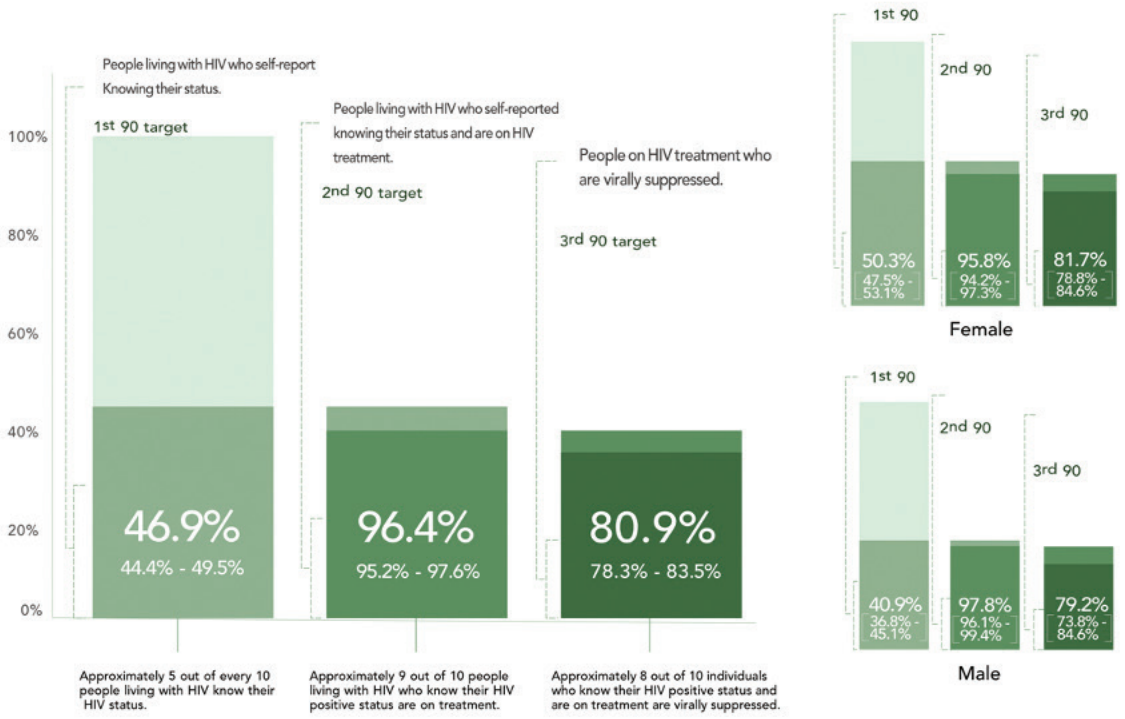

Figure 11.A Adult 90-90-90: Conditional percentages (adjusted for laboratory antiretroviral data among adults aged 15-64 years), NAIIS 2018

12. Clinical Perspectives on People Living with HIV

12.1 Background

Nigeria implemented the "test and treat" policy for all in 2016. Ensuring the treatment program is people-centered and innovative to meet this policy requires diligent monitoring and responsiveness.[1] Clinical indicators such as CD4 count at diagnosis and retention on ART can provide evidence of the ability to reach vulnerable populations and quality of care. The distribution of CD4 counts also reflects population health and the potential impact of HIV on mortality.

12.2 Results

Tables 12.A to 12.E and Figure 12.A present data on clinical characteristics of PLHIV from the survey.

12.2.1 Key Findings

- Among newly diagnosed HIV-positive adults aged 15-64 years who self-reported being HIV negative and had no detectable ARVs, 9.3% had a CD4 count <200 cells/µLl and 29.5% had <350 cells/µLl (Table 12.B).
- Among HIV-positive adults aged 15-64 years who self-reported being on ART ≤12 months prior to the survey, 77.9% of women and 81.7% of men were virally suppressed (Table 12.E).
- Among HIV-positive adults aged 15-64 years who initiated ART ≤12 months prior to the survey, 95.2% were still receiving ART (Table 12.C).
- Among HIV-positive adults aged 15-64 years who initiated ART >12 months prior to the survey, 94.3% were still receiving ART (Table 12.D).
- Among HIV-positive adults aged 15-64 years with VLS, 28.3% reported not being on ART (30.5% among women and 24.7% among men) (Table 12.E).

[1]The interquartile range (IQR) is a measure of variability, based on dividing a data set into quartiles. Quartiles divide a rank-ordered data set into four equal parts. The values that divide each part are called the first, second and third quartiles, and they are denoted by Q1, Q2 and Q3, respectively.

[2]Education categories refer to the highest level of education attended, whether that level was completed.

An asterisk indicates that an estimate is based on a very small number (30 or less) of unweighted cases and has been suppressed.

13. Prevention of Mother-to-Child HIV Transmission

13.1 Background

PMTCT, also known as prevention of vertical transmission, refers to interventions to prevent transmission of HIV from an HIV-positive mother to her infant during pregnancy, labor, delivery or breastfeeding.[1] To prevent mother-to-child HIV transmission (MTCT), WHO recommends a comprehensive four-pronged approach: (1) primary prevention of HIV infection among women, especially young women; (2) prevention of unintended pregnancies among HIV-positive women; (3) provision of specific interventions to reduce HIV transmission from HIV-infected women to their infants; and (4) provision of treatment, care and support for HIV-positive mothers, their infants and family.[2,3]

13.2 Results

Tables 13.A to 13.D present statistics on ANC attendance, breastfeeding practices, awareness of a woman's HIV status prior to or during pregnancy, use of ART during pregnancy in women who were aware of their HIV-positive status during pregnancy and infant HIV testing to confirm HIV infection through self-report by the mother and through biomarker testing during the survey.

13.2.1 Key Findings

- In the three years preceding the survey:
  - 76.3% of women aged 15-49 years who delivered in the three years preceding the survey attended at least one ANC visit, 87.1% in urban areas and 68.1% in rural areas (Table 13.A).
  - ANC attendance for women aged 15-49 years was lowest for those with no education (56.9%) and highest for those with tertiary education (97.6%) (Table 13.A).
  - ANC attendance was lowest among women aged 15-19 years (64.6%) and highest among women aged 35-39 years (80.6%) (Table 13.A).
  - 84.3% of those who knew their HIV-positive status received ARVs (Table 13.D).
- Among women aged 15-49 years who gave birth within the past 12 months, 41.5% reported knowing their status during their pregnancy (Table 13.C).

An asterisk indicates that an estimate is based on a very small number (30 or less) of unweighted cases and has been suppressed.

14. Adolescents and Young People

14.1 Background

A third of the sub-Saharan Africa population is made up of individuals between the ages of 10 and 24 years.[1] Young people aged 15-24 years are more likely to engage in risky sexual behaviors than older adults and less likely to visit health care facilities. Control of HIV in this population is particularly challenging but critical for long-term epidemic control.[1]

14.2 Results

Table 14.A shows the prevalence of early sexual debut before 15 years among young persons aged 15-24 years. Tables 14.B to 14.D show knowledge of HIV prevention among adolescents aged 10-14 years. These knowledge data were measured by asking participants to agree or disagree with both accurate and inaccurate statements about HIV prevention.

14.2.1 Key Findings

- Among young people aged 15-24 years, 18.1% reported sexual debut before the age of 15 years (Table 14.A).
- Among young women aged 15-24 years, sexual debut before age 15 years was 24.2% in rural areas compared to 13.8% in urban areas (Table 14.A).
- Comprehensive knowledge of HIV prevention among adolescents aged 10-14 years was 1.4% (girls 1.2%, boys 1.7%) (Table 14.B, Table 14.C, Table 14.D).

15. HIV Risk Factors

15.1 Background

During NAIIS, participants were asked questions about high-risk behaviors, including early sexual debut, recent engagement with multiple sexual partners, condom use at last sexual intercourse, recent engagement in paid sexual intercourse and condom use at last sexual intercourse with a non-marital, non-cohabitating partner. With this information, programs can focus resources to reach individuals most at risk for HIV infection and individuals most in need of information.

In 2007, WHO and UNAIDS recommended voluntary medical male circumcision as a cost-effective strategy to reduce the spread of HIV. Therefore, men aged 15-64 years were asked if they had been medically or traditionally circumcised.

15.2 Results

Tables 15.A to 15.E illustrate NAIIS data about HIV risk factors.

15.2.1 Key Findings

- Among men aged 15-64 years, HIV prevalence was 1.5% among those with no condom use during sex with a non-marital, non-cohabiting partner compared to 0.9% among those who used condoms with a non-marital, non-cohabiting partner (Table 15.A).
- Among married men who had sex with a non-marital, non-cohabiting partner in the past 12 months, 34.3% reported using a condom the last time they had sex compared to 17.3% of married women (Table 15.B, Table 15.C).
- Among men aged 15-64 years, 28.0% self-reported medical circumcision status, 56.8% reported non-medical circumcision status and 1.8% reported being uncircumcised (Table 15.E).

Table 15.A HIV prevalence by sexual behavior

Prevalence of HIV among persons aged 15-64 years who ever had vaginal sex by sex and sexual behavior characteristics, NAIIS 2018

16. HBV and HCV Screening and TB Services

16.1 Background

PLHIV are at risk for acquiring other infections, including tuberculosis (TB), hepatitis B virus (HBV) and hepatitis C virus (HCV). TB is the leading cause of death for PLHIV in Africa. HIV infection predisposes a person to TB infection and progression to active disease. Information regarding health seeking behavior, particularly for TB health services, is therefore very important.

HIV, HBV and HCV have similar transmission routes and concurrent infection with HIV and either HBV or HCV often results in more rapid progression of HBV or HCV to cirrhosis and higher liver-disease mortality. NAIIS 2018 provides population-based HBV and HCV prevalence among HIV-positive individuals aged 15-64 years and a subset of HIV-negative individuals, which supports actionable policy recommendations for screening and treatment. This chapter describes the prevalence of HBV and HCV in persons aged 15 to 64, by sex, age, socio-demographic characteristics and HIV status.

16.2 Results

Tables 16.A to 16.C report NAIIS findings on co-infections associated with HIV.

16.2.1 Key Findings

- The overall prevalence of HBV infection among adults aged 15-64 years was 8.1% (10.3% in men and 5.8% in women). HBV prevalence peaked at ages 35-39 years (10.2%) and was lowest at ages 55-59 years (2.5%) (Table 16.A).
- The overall prevalence of HCV infection among individuals aged 15-64 years was 1.1% (1.3% in men and 1.0% in women). HCV prevalence peaked at ages 50-54 years (3.3%) and was lowest at ages 15-19 years (0.4%) (Table 16.B).
- The prevalence of HBV infection among HIV-positive adults aged 15-64 years was 8.9% (Table 16.A).
- The prevalence of HCV among HIV-positive adults aged 15-64 years was 1.1% (Table 16.B).
- Among adults found to be HIV-positive during NAIIS 2018, 9.9% had ever visited a clinic for TB evaluation.

Table 16.A Hepatitis B virus (HBV) infection prevalence by sex and demographic characteristics: Persons aged 15-64 years

APPENDIX A SAMPLE DESIGN METHODOLOGY

Appendix A provides a high-level overview of NAIIS sampling and weighting procedures. In-depth details are provided in the Sampling and Weighting Document, which may be found on the NAIIS project website.

A.1 Sample Design

Overview

The NAIIS sample design was a stratified multistage probability sample design, with strata defined by the 37 states of the country. First-stage primary sampling units were defined as EAs created for the 2006 census. Second-stage sampling units were defined as households within EAs and, finally, eligible persons within households. Within each state, EAs were selected with probabilities proportionate to the 2018 projected number of households in the EA based on the 2006 census. The allocation of the sample EAs to the 37 states was designed to achieve specified precision levels for (1) a national estimate of HIV incidence and (2) state-level estimates of HIV prevalence and viral load suppression (VLS). The second-stage sampling units were selected from lists of dwelling units/households compiled by trained staff for each of the sampled EAs. Upon completion of the listing process, a random systematic sample of 28 dwelling units/households was selected from each EA, except for Lagos where eight dwelling units/households were selected from each EA. Within the sampled households, all eligible adults aged 15-64 years were included in the study sample for data collection. All eligible children aged 0-14 years in a subsample of the sampled households were included in the study for data collection.

Population of Inference

The population of inference for NAIIS was comprised of the *de facto* household population. The *de facto* population was comprised of individuals who were present in households, i.e., slept in the household, on the night prior to the household interview. In contrast, the *de jure* population is comprised of individuals who are usual residents of the household, irrespective of whether they slept in the household on the night prior to the household interview.

Precision Specifications and Assumptions

The following specifications were used to develop the sample design for NAIIS.

- The relative standard error of the national estimate of HIV incidence among persons aged 15-64 was set at ~30%.
- The 95% confidence intervals were used for the estimated VLS rate among HIV-positive persons aged 15-64 in each of the 37 strata (states) calculated at ~10%.

The following assumptions were used to develop the sample design for NAIIS:

- An overall HIV prevalence rate of 3.4% that varied by state.
- An annual HIV incidence rate for adults aged 15-64 of 0.49%.
- A MDRI of 130 days, yielding an annualization rate of 365/130 = 2.8077. Hence, the estimated HIV incidence rate for MDRI = 130 days was Pm= 0.0060/2.8077 = 0.0021 (0.21%).
- The VLS rate among HIV-positive adults aged 15-49 in each state h of Pvh = 50%. This was a conservative assumption because it overstated the actual variance of the VLS rate.
- An intra-cluster correlation (ICC) of 0.02 for both prevalence and incidence. The ICC provided an average measure of the homogeneity of responses within the first-stage sampling units.

- An occupancy rate of 100% was used for sampled dwelling units. Note that this was not included in the calculation of the overall survey response rate but does determine the initial numbers of dwelling units to be sampled.
- An overall household response rate of 90.6% was witnessed among the occupied dwelling units.[1]
- The average number of persons aged 15-64 in a household was 2.47.[1]
- The percentage of persons in households who were aged 0-14 was 45.7%.[1]
- The percentage of persons in households who were aged 15-64 was 48.2%.[1]
- Among individuals aged 15-64 in eligible responding households, the biomarker response rate was 77.3%. This corresponded to an overall biomarker response rate of 63%. This was a conservative estimate derived from response rates in the 2012 National HIV & AIDS and Reproductive Health Survey (NARHS 2012).[1]
- Among children aged 0-14 in eligible responding households, the biomarker response rate was 63%.

[1]The assumed values of response rates and number of participating persons per household were based on data from the 2013-14 Nigeria Demographic and Health Survey (DHS) and NARHS 2012.

Selection of the Primary Sampling Units (PSUs)

The sampling frame consisted of 662,855 EAs containing 28,900,478 households and 140,431,798 persons. A stratified sample of 4,035 EAs was selected from the sampling frame. The 37 strata specified for sampling were the 37 states of Nigeria. The EA samples were selected systematically and with probabilities proportionate to a measure of size (MOS) equal to the 2018 projected number of households in the EA based on the 2006 census. Prior to selection, the EAs were sorted by type of EA, including urban/rural and other geographic variables in the frame. The sorting of the EAs prior to sample selection induces an implicit geographic stratification. To select the sample from an individual stratum, the cumulative MOS was determined for each EA in the ordered list of EAs and the sample selections were designated using a sampling interval equal to the total MOS of the EAs in the stratum divided by the number of EAs to be selected and a random starting point. The resulting sample has the property that the probability of selecting an EA within an individual stratum is proportional to the MOS of the EA in the stratum.

Selection of Households

For both sampling and analysis purposes, a household is defined to be a group of individuals who reside in a physical structure such as a house, apartment, compound or homestead and share in housekeeping arrangements. The physical structure in which people reside is referred to as the dwelling unit, which may contain more than one household meeting the above definition. Households are eligible for participation in the study if they are located within the sampled EA.

The selection of households for NAIIS involved the following steps: (1) listing the dwelling units/households within the sampled EAs; (2) assigning eligibility codes to the listed dwelling unit/household records; (3) selecting the samples of dwelling units/households; and (4) designating a subsample of households for data collection for children.

A description of the household listing process as well as a summary of household eligibility may be found in the Sampling and Weighting Document. Twenty-eight households were sampled from each cluster in all states except for Lagos state, where eight households were sampled per cluster.

Selection of Individuals

The selection of individuals for NAIIS involved the following steps: (1) compiling a list of all individuals

known to reside in the household or who slept in the household during the night prior to data collection; (2) identifying those rostered individuals who were eligible for data collection; and (3) selecting for the study those individuals meeting the age and residency requirements of the study. However, only those individuals who slept in the household the night before the household interview, i.e., the *de facto* population, were retained for subsequent weighting and analysis.

A.2 Weighting

Overview

In general, the purpose of weighting survey data from a complex sample design is to (1) compensate for variable probabilities of selection, (2) account for differential nonresponse rates within relevant subsets of the sample and (3) adjust for possible under-coverage of certain population groups. Weighting is accomplished by assigning an appropriate sampling weight to each responding sampled unit (e.g., a household or person) and using that weight to calculate weighted estimates from the sample. The critical component of the sampling weight is the base weight that is defined to be the reciprocal of the probability of including a household or person in the sample. The base weights are used to inflate the responses of the sampled units to population levels and are generally unbiased (or consistent) if there is no nonresponse or noncoverage in the sample. When nonresponse or noncoverage occurs in the survey, weighting adjustments are applied to the base weights to compensate for both types of sample omissions.

Nonresponse is unavoidable in virtually all surveys of human populations. For NAIIS, nonresponse could occur at different stages of data collection, including (1) before the enumeration of individuals in the household, (2) after household enumeration and selection of persons but before completion of the individual interview and (3) after completion of the interview but before collection of a viable blood sample.

Noncoverage could arise when some members of the survey population have no chance of being selected for the sample. For example, noncoverage could occur if the field operations fail to enumerate all dwelling units during the listing process or if certain household members are omitted from the household rosters. To compensate for such omissions, the post-stratification procedures are used to calibrate the weighted sample counts to available population projections.

Methods

The overall weighting approach for NAIIS included several steps. Methods and results for each of the steps below are detailed in the Sampling and Weighting Document.

Initial checks: Checks of the data files were carried out as part of the survey and data quality control and the probabilities of selection for EAs and households are calculated and checked.

Calculation of PSU base weights: The weighting process began with the calculation and checking of the sample EA base weights as the reciprocals of the overall PSU probabilities of selection.

Calculation of household weights: The next step was to calculate household weights. The household base weights were calculated as the EA weights multiplied by the reciprocal of the within-EA household selection probabilities. The household base weights were adjusted first to account for dwelling units for which it could not be determined whether the dwelling unit contained an eligible household and then the responding households had their weights adjusted to account for non-responding eligible households. This adjustment was made based on the EA the households are in and the resulting weight was the final household weight.

Calculation of person-level interview weights: Once the household weights were determined, they were used to calculate the individual base weights. The individual base weights were then adjusted for nonresponse among the eligible individuals, with a final adjustment for the individual weights to compensate for under-coverage in the sampling process by post-stratifying, i.e., weighting up, to 2018 population projections.

Calculation of person-level HIV testing weights: The individual weights adjusted for nonresponse were in turn the initial weights for the HIV testing data sample, with a further adjustment for nonresponse to HIV testing and a final post-stratification adjustment to compensate for under-coverage.

Appendix B Laboratory Methodology

B.1 Field-Based Laboratory Procedures

Trained and qualified survey laboratory staff collected whole blood specimens from identified eligible and consenting participants. Specimen volume varied by age: a 14 mL venous blood specimen was collected from adults aged 15-64 years, a 6 mL venous blood specimen was collected from children aged 2-14 years and a 1 mL capillary blood specimen was collected from children aged <2 years, using a finger stick for children aged 6 to 23 months and a heel stick for infants below 6 months of age. For participants ≥2 years who could not provide a venous blood specimen, blood was collected from a finger stick using the 1 ml ethylene diamine tetra acetic acid (EDTA) microtube.

Blood samples were labeled with a unique pre-printed bar-coded participant identification number (PTID) and stored in temperature-controlled cooler boxes with ultra-low freezer packs which were replenished daily. At the end of each day, specimens were transported to a satellite laboratory for processing into plasma aliquots and dried blood spots (DBS) and were frozen within 24 hours of blood collection.

B.2 Household-Based Procedures

HBTC services, including HIV rapid testing and counseling, HBsAg and HCV rapid testing, point-of-care (POC) CD4 testing and return of results, were carried out in accordance with Nigeria's National HIV Testing Guidelines. HIV rapid testing was conducted in the field (Figure B.1) using a serial rapid-testing algorithm. Determine™ HIV ½ (Abbott Molecular Inc., Des Plaines, Illinois, United States) was used as a screening test. Uni-Gold™ (Trinity Biotech, plc., Wicklow, Ireland) was used as a confirmatory test. STAT PAK® HIV ½ Assay (Chembio Diagnostic Systems Inc., Medford, New York, United States) was used as a tie-breaker test for discordant screening and confirmatory tests. NAIIS participants with non-reactive results on the screening test were reported as HIV negative; those with a reactive screening test underwent confirmatory testing. Participants with reactive results on both the screening and confirmatory tests were classified as HIV-positive. Participants with a reactive screening test result, followed by a non-reactive confirmatory test result, had the tie-breaker test performed to determine HIV status. Participants with reactive tie-breaker tests were classified as HIV-positive while those with non-reactive tests were classified as HIV-negative.

Figure B.1 Nigerian National Serial HIV Rapid Testing Algorithm, NAIIS 2018

CD4 Testing

CD4 cell count was measured for all participants who tested HIV positive and a randomly selected 2% of the population who tested HIV negative. All CD4 testing was performed using the validated Pima™ CD4 Point of Care Testing (POCT) system (Abbott Molecular Inc., Chicago, IL, United States, formerly Alere).

Hepatitis B Virus (HBV) and Hepatitis C Virus (HCV) Testing

All HIV-positive participants (aged 15-64) and approximately 5,303 randomly selected HIV-negative respondents (aged 15-64) were screened for HBV using Determine™ HBsAg test kit (Abbott Inc., Chicago, Illinois, United States, formerly Alere) and for HCV using OraQuick® HCV Rapid Antibody Test (Orasure Technologies, Inc., Bethlehem, Pennsylvania, United States). Participants with a positive HCV antibody result underwent confirmatory HCV RNA quantitative PCR testing (viral load test) using Roche platform.

Quality Assurance (QA) and Quality Control (QC)

QC panels consisting of positive and negative control specimens and PT panels which contained blinded positive and negative levels of all biomarkers (HIV, HBV and HCV) were regularly distributed to both the field and satellite laboratories. To ensure that test kits and staff competencies were adequately monitored, bi-weekly QC testing and two rounds of PT panels were completed. The first 50 HIV rapid tests performed by each field laboratorian were retested at the satellite lab until concordance was 100%.

B.3 Satellite and Central Laboratory-Based Procedures

At the satellite laboratories, specimens were processed into plasma aliquots and one to two DBS cards, depending on age of the participant and volume of the specimen. For infants <2 years, who provided blood from a heel stick in a one mL microtube, one to two DBS cards were prepared. All DBS cards were prepared in the laboratory. Plasma and DBS samples were labeled with unique bar-code labels generated from the LDMS. Plasma aliquots and DBS were frozen within 24 hours of blood collection. Specimens were stored in the satellite laboratories in -20^{o}C freezers with temperature control monitors. Within a week, specimens were transported to the central laboratory using the cooler boxes with ultra-low freezer packs. At the central laboratory, specimens were stored in -80^{o}C freezers with temperature control monitors in a purpose-built biorepository with a secured electrical supply.

Geenius™ HIV 1/2 Testing

All HIV-positive specimens were retested at the satellite laboratory using Geenius™ HIV 1/2 Supplemental Assay (Bio-Rad, Hercules, California, United States) as the confirmatory test. Participants who had reactive results on both rapid and Geenius™ HIV 1/2 tests were classified as HIV-positive. Participant specimens with a reactive rapid test result followed by a non-reactive confirmatory test result at the satellite laboratory were subjected to further QA discrepancy resolution at the central laboratory. Specimens from participants who self-reported being HIV positive with an HIV negative test result at HBT received further testing, including additional HIV serial rapid testing and Geenius™ HIV 1/2 testing in the satellite and central laboratories as well as deoxyribonucleic acid (DNA) polymerase chain reaction (PCR) to resolve discrepancies.

HIV Viral Load Testing

VL testing of HIV-positive participants was done using the Roche solutions for molecular diagnostics (COBAS® AmpliPrep/COBAS® TaqMan® HIV-1 Test, version 2.0, Roche Molecular Diagnostics, Indianapolis, Indiana, United States).

HIV-1 VL using DBS specimens from children and adults with an insufficient volume of plasma was measured on the Roche COBAS® AmpliPrep instrument and COBAS® TaqMan® 48 analyzer using the COBAS® AmpliPrep/COBAS® TaqMan® free virus elution (FVE) protocol, HIV-1 Test version 2.0 (Roche Molecular Diagnostics, Branchburg, New Jersey, United States) and internal QC was performed according to the manufacturer's specifications.

VL results were sent to the health facilities selected by the HIV-positive participant within 8 to 10 weeks of specimen collection. The facility referral focal person contacted the HIV-positive participant via mobile phone, informing them that their VL results were available. The facility referral focal person also used the mobile phone to document that the participant enrolled into care, initiated on antiretroviral therapy (ART) and received viral load results using the Unstructured Supplementary Service Data (USSD) codes.

Classification of Final HIV Status

For participants aged 18 months-64 years, the algorithm for classification of final HIV status included results from rapid HIV testing and Geenius™ HIV 1/2 confirmatory testing on all positives. In addition, Western Blot, TNA PCR and VL RNA PCR were done on discrepant results. For participants less than 18 months, the algorithm for classification of final HIV status included results from rapid HIV testing and HIV TNA PCR. Classification of final HIV status was used to determine estimates for HIV prevalence and to inform estimates for HIV incidence.

Infant HIV Virologic Testing (IVT)/Early Infant Diagnosis (EID)

All infants <18 months were tested for HIV using the Determine™ HIV 1/2 Rapid Test. Infants who were reactive on Determine received IVT/EID testing using prepared DBS. In addition, infants born to mothers of unknown HIV status or HIV-positive mothers were screened using the Determine™ HIV 1/2 HIV Test and received IVT/EID testing using prepared DBS. HIV TNA PCR using COBAS® TaqMan® HIV-1 Qualitative Test (Roche Molecular Systems, Branchburg, NJ, USA) United States) analyzer was conducted at the central laboratory. Specimens with HIV-negative results were categorized as HIV negative while specimens with HIV-positive results were reported as HIV-positive. Results were returned to the infant's parent or guardian at the household within two weeks of specimen collection.

HIV Recent Infection Testing Algorithm

A total of 2,759 specimens were tested at the central laboratory for HIV incidence at the end of data collection. Specimens from HIV-positive participants ≥18 months old were tested for recent HIV infection using the HIV-1 Limiting Antigen (LAg) Avidity Assay Testing Algorithm (Figure B.2). This assay was based on the principle of Enzyme Immunoassay (EIA).

Two different laboratory-based testing algorithms were used to estimate incidence for PLHIV participants ≥18 months old. HIV-1 LAg Avidity plus VLVL and HIV-1 LAg Avidity plus viral load and ARV detection were used to distinguish recent from long-term infection. Incidence estimates were obtained using the formula recommended by the WHO Incidence Working Group and Consortium for Evaluation and Performance of Incidence Assays, with assay performance characteristics of an MDRI of 130 days (95% CI: 118, 142), a time cutoff (T) of 1.0 year and a residual proportion false recent (PFR) of 0.00. Each algorithm employed a combination of assays: HIV-1 LAg Avidity EIA (Sedia Biosciences Corporation, Portland, Oregon, United States) and VL (Figure B.2) and HIV-1 LAg Avidity EIA, VL and ARV detection.

Specimens with a normalized optical density (ODn) value ≤2.0 during initial testing were confirmed by further testing of the specimen in triplicate. For those HIV-positive specimens with median normalized ODn value ≤1.5, VL results were reviewed to increase the positive predictive value of true recent infections. Specimens with ODn values >1.5 were classified as long-term infections. Specimens with final ODn value <0.4 were retested by the HIV diagnostic testing algorithm to confirm HIV-1 seropositivity (Figure B.2).

Specimens identified as HIV negative based on the ODn reading were excluded from the total number of HIV-positive specimens and incorporated into the total number of HIV-negative specimens for incidence estimation. Specimens with VL <1,000 copies/mL were classified as long-term infections, while those with VL ≥1,000 copies/mL were classified as recent infections (Figure B.2). In the ARV-adjusted algorithm, specimens with VL ≥1,000 copies/mL and with detectable ARVs were classified as long-term infections, while specimens with VL ≥1,000 copies/mL and without detectable ARVs were classified as recent infections.

Incidence estimation is based on recent/long-term (LT) classification using algorithms with LAg Avidity.[1,2,3] The first testing algorithm (i.e., HIV-1 LAg Avidity plus VL) uses VL testing to exclude specimens with low VL and limit misclassification of persons as recent infections who are elite controllers or on effective ART. The second algorithm (i.e., HIV-1 LAg Avidity plus VL and ARV detection) uses ARV detection to exclude specimens with high VL and limit misclassification as recent infections of persons who are on ART but have poor treatment adherence.

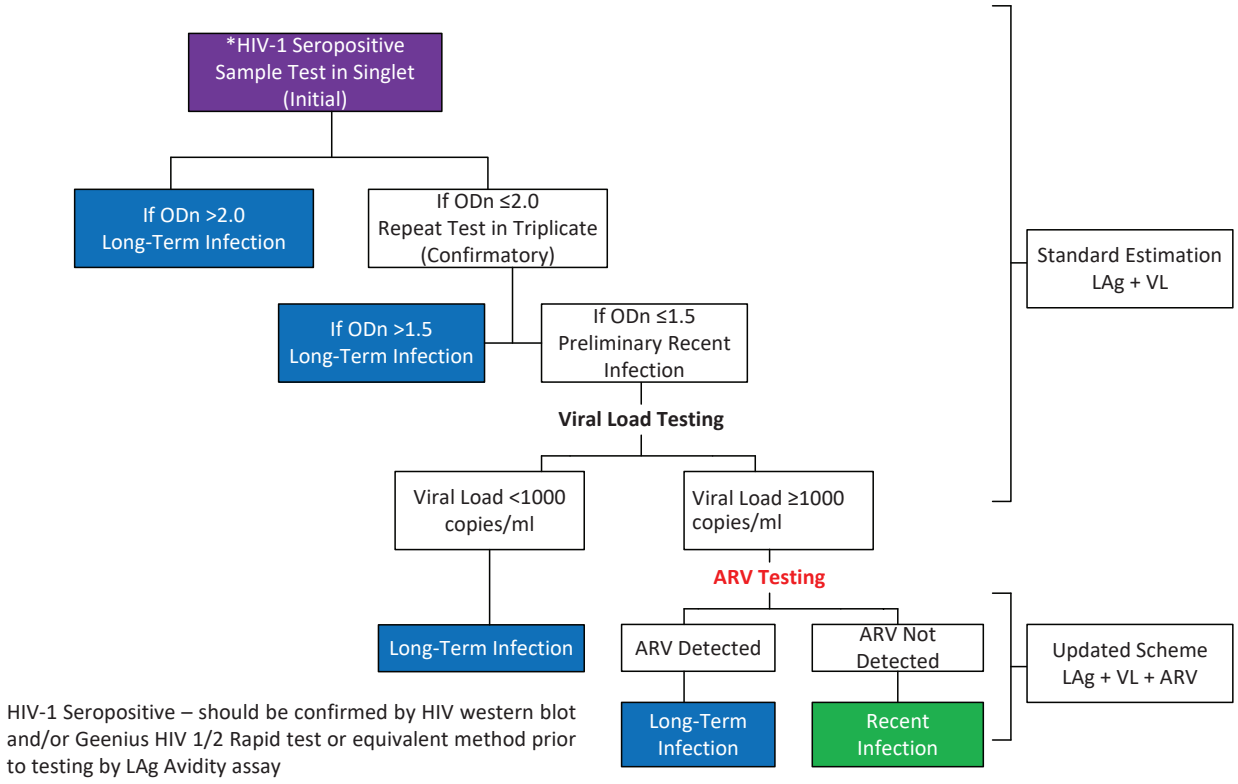

Figure B.2 Testing Algorithm for LAg Avidity Testing, NAIIS 2018

Detection of Antiretrovirals

ARV detection was performed by the Division of Clinical Pharmacology of the Department of Medicine at the University of Cape Town, South Africa. Qualitative screening, for detectable concentrations of ARVs, was conducted on DBS specimens from all HIV-positive adults and children using high-resolution liquid chromatography coupled with tandem mass spectrometry (MS). Protein precipitation followed by high performance liquid chromatography with MS/MS detection using a gradient elution methodology described by Koal et al.[1] was used for the qualitative determination of four ARV drugs from DBS This qualitative assay separates the parent compound from the fragments and is highly specific and highly sensitive, with a limit of detection of 0.02 µg/mL for each drug and a signal-to-noise ratio of at least 5:1 for all drugs. Four ARVs, efavirenz, lopinavir, atazanavir and nevirapine, were selected as markers for the most commonly prescribed first- and second-line regimens. These ARVs have relatively long half-lives, allowing for a longer period of detection following intake. Detection of ARVs indicates participant use of a given drug at the time of blood collection. Specimens from participants who were virally suppressed or self-reported being on ART but had no evidence of the first three compounds were tested for nevirapine. Results below the limit of detection among individuals who reported taking ART indicate that there was no recent exposure to the regimen and that adherence to a prescribed regimen was suboptimal, but cannot be interpreted as "not on ART." Given the limited number of ARVs selected for detection, NAIIS could not rule out the use of other ART regimens.

APPENDIX C ESTIMATES OF SAMPLING ERRORS

Estimates from sample surveys are affected by two types of errors: non-sampling errors and sampling errors. Non-sampling errors result from mistakes made during data collection, e.g., misinterpretation of an HIV test result and data management errors such as transcription errors during data entry. While NAIIS implemented numerous quality assurance and control measures to minimize non-sampling errors, these were impossible to avoid and difficult to evaluate statistically. In contrast, sampling errors can be evaluated statistically. Sampling errors are a measure of the variability between all possible samples. The sample of respondents selected for NAIIS was only one of many samples that could have been selected from the same population, using the same design and expected size. Each of these samples could yield results that differed somewhat from the results of the actual sample selected. Although the degree of variability cannot be known exactly, it can be estimated from the survey results.

The standard error, which is the square root of the variance, is the usual measurement of sampling error for a statistic (e.g., proportion, mean, rate, count). In turn, the standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of approximately plus or minus two times the standard error of that statistic in 95% of all possible samples of identical size and design.

NAIIS utilized a multi-stage stratified sample design, which required complex calculations to obtain sampling errors. The Taylor linearization method of variance estimation was used for survey estimates that are proportions, e.g., HIV prevalence. The Jackknife repeated replication method was used for variance estimation of more complex statistics such as rates, e.g., annual HIV incidence and counts such as the number of people living with HIV.

The Taylor linearization method treats any percentage or average as a ratio estimate, $r = y/x$, where *y* represents the total sample value for variable *y* and *x* represents the total number of cases in the group or subgroup under consideration. The variance of *r* is computed using the formula given below, with the standard error being the square root of the variance:

$$SE^2(r) = \text{var}(r) = \frac{1-f}{x^2}\sum_{h=1}^{H}\left[\frac{m_h}{m_h-1}\left(\sum_{i=1}^{m_h} z_{hi}^2 - \frac{z_h^2}{m_h}\right)\right]$$

in which

$$z_{hi} = y_{hi} - rx_{hi} \text{ and } z_h = y_h - rx_h$$

Where h represents the stratum, which varies from 1 to *H*,

m_h is the total number of clusters selected in the h^{th} stratum,

y_{hi} is the sum of the weighted values of variable *y* in the i^{th} cluster in the h^{th} stratum,

x_{hi} is the sum of the weighted number of cases in the i^{th} cluster in the h^{th} stratum and,

f is the overall sampling fraction, which is so small that it is ignored.

In addition to the standard error, the design effect for each estimate is also calculated. The design effect is defined as the ratio of the standard error using the given sample design to the standard error that would result if a simple random sample had been used. A design effect of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design. Confidence limits for the estimates, which are calculated as

$$r \pm t_{(0.975,K)} \sqrt{\mathrm{var}(r)}$$

where $t_{(0.975,\,K)}$ is the 97.5th percentile of a *t*-distribution with *K* degrees of freedom, are also computed.

Sampling errors for selected variables from NAIIS are presented in Tables C.1 through C.9. For most variables, sampling error tables include the weighted estimate, unweighted denominator, standard error or design effect and lower- and upper-95% confidence limits.

614	Does (INITIALS) know your HIV status? HIV status could mean you are HIV negative or HIV positive.	YES . . . . 1 NO . . . . 2 DON'T KNOW . 8 REFUSED 9	YES . . . . 1 NO . . . . 2 DON'T KNOW . 8 REFUSED 9	YES . . . . 1 NO . . . . 2 DON'T KNOW . 8 REFUSED 9
615	What is the HIV status of (INITIALS)? READ THE RESPONSES ALOUD.	I THINK [INITIALS] IS POSITIVE . 1 [INITIALS] TOLD ME HE/SHE IS POSITIVE . 2 [INITIALS] IS POSITIVE, TESTED TOGETHER . 3 I THINK [INITIALS] IS NEGATIVE . 4 [INITIALS] TOLD ME HE/SHE IS NEGATIVE . . . 5 [INITIALS] IS NEGATIVE, TESTED TOGETHER . 6 DON'T KNOW STATUS . . . . . 8 REFUSED 9	I THINK [INITIALS] IS POSITIVE . 1 [INITIALS] TOLD ME HE/SHE IS POSITIVE . 2 [INITIALS] IS POSITIVE, TESTED TOGETHER . 3 I THINK [INITIALS] IS NEGATIVE . 4 [INITIALS] TOLD ME HE/SHE IS NEGATIVE . . . 5 [INITIALS] IS NEGATIVE, TESTED TOGETHER . 6 DON'T KNOW STATUS . . . . . 8 REFUSED 9	I THINK [INITIALS] IS POSITIVE . 1 [INITIALS] TOLD ME HE/SHE IS POSITIVE . 2 [INITIALS] IS POSITIVE, TESTED TOGETHER . 3 I THINK [INITIALS] IS NEGATIVE . 4 [INITIALS] TOLD ME HE/SHE IS NEGATIVE . . . 5 [INITIALS] IS NEGATIVE, TESTED TOGETHER . 6 DON'T KNOW STATUS . . . . . 8 REFUSED 9
616	CHECK 603: HAS RESPONDENT HAD ANOTHER PARTNER IN THE LAST 12 MONTHS? I will now ask you about the person you have had sex with prior to (INITIALS).	YES . . . . 1 (GO BACK TO 604 IN NEXT COLUMN) NO . . . . 2 (END MODULE)	YES . . . . 1 (GO BACK TO 604 IN NEXT COLUMN) NO . . . . 2 (END MODULE)	

MODULE 7: HIV TESTING

700 Now I would like to ask you some questions about HIV testing.

NO.	QUESTIONS AND FILTERS	CODING CATEGORIES	SKIP
701	Have you <u>ever</u> been tested for HIV?	YES . . . . . 1 NO . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	→ 703 → 901
702	Why have you never been tested for HIV? SELECT ALL THAT APPLY.	DON'T KNOW WHERE TO TEST . . . . . A TEST COSTS TOO MUCH . . . . . B TRANSPORT COSTS TOO MUCH . . . . . C TOO FAR AWAY . . . . . D AFRAID OTHERS WILL KNOW ABOUT TEST RESULTS . . . . . E DON'T NEED TEST/LOW RISK . . . . . F DID NOT RECEIVE PERMISSION FROM SPOUSE/FAMILY . . . . . G AFRAID SPOUSE/PARTNER/ FAMILY WILL KNOW RESULTS . . . . . H DON'T WANT TO KNOW I HAVE HIV . . . I CANNOT GET TREATMENT FOR HIV . . . J TEST KITS NOT AVAILABLE . . . . . K RELIGIOUS REASONS . . . . . L OTHER _____ X (SPECIFY) DON'T KNOW . . . . . Y REFUSED . . . . . Z	→ 901
703	What month and year was your last HIV test?	MONTH . . . . . ☐☐ DON'T KNOW . . . . . 98 REFUSED . . . . . 99 YEAR . . . . . ☐☐☐☐ DON'T KNOW . . . . . 9998 REFUSED 9999	
704	Where was the last test done?	VCT FACILITY . . . . . 01 MOBILE VCT . . . . . 02 AT HOME . . . . . 03 HEALTH CLINIC / FACILITY . . . . . 04 HOSPITAL OUTPATIENT CLINIC . . . . . 05 TB CLINIC . . . . . 06 STI CLINIC . . . . . 07 HOSPITAL INPATIENT WARDS . . . . . 08 BLOOD DONATING CENTER . . . . . 09 ANC CLINIC . . . . . 10 OTHER _____ 96 (SPECIFY) DON'T KNOW . . . . . 98 REFUSED 99	

NO.	QUESTIONS AND FILTERS	CODING CATEGORIES	SKIP
705	What was the result of that HIV test?	POSITIVE . . . . . 1 NEGATIVE . . . . . 2 UNKNOWN/INDETERMINANTE . . . . . 3 DID NOT RECEIVE THE RESULT . . . . . 4 DON'T KNOW . . . . . 8 REFUSED 9	→ END OF MODULE
706	What was the month and year of your first HIV positive test result? Please give your best guess. This will be the very first HIV positive test result that you have received. PROBE TO VERIFY DATE.	MONTH . . . . . ☐☐ DON'T KNOW . . . . . 98 REFUSED . . . . . 99 YEAR . . . . . ☐☐☐☐ DON'T KNOW . . . . . 9998 REFUSED 9999	
707	Of the following people, who have you told that you are HIV positive? CHECK ALL THAT APPLY.	NO ONE . . . . . A SPOUSE/SEX PARTNER . . . . . B DOCTOR . . . . . C FRIEND . . . . . D FAMILY MEMBER . . . . . E OTHER _____ X (SPECIFY) DON'T KNOW . . . . . Y REFUSED . . . . . Z	
708a	Now I would like to ask you questions about your experiences with health care providers.		
708	In the last 12 months, when you sought health care in a facility where your HIV status is not known, did you feel you needed to hide your HIV status?	YES . . . . . 1 NO, NO NEED TO HIDE . . . . . 2 NO, NO NEED TO ATTEND HEALTH FACILITY IN LAST 12 MONTHS . . . . . 3 DON'T KNOW . . . . . 8 REFUSED 9	
709	In the last 12 months, have you been denied health services including dental care, because of your HIV status?	YES . . . . . 1 NO . . . . . 2 NO ONE KNOWS MY STATUS . . . . . 3 DON'T KNOW . . . . . 8 REFUSED 9	

MODULE 8: HIV STATUS, CARE AND TREATMENT

NO.	QUESTIONS AND FILTERS	CODING CATEGORIES	SKIP
800a	CHECK 705: IS THE RESPONDENT HIV POSITIVE?	YES . . . . . 1 NO 2	→ END MODULE
800	Now I am going to ask you more about your experience with HIV support, care and treatment.		
801	After learning you had HIV, have you ever received HIV medical care from a doctor, clinical officer or nurse?	YES . . . . . 1 NO . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	→ 803 → 806
802	What is the main reason why you have never received HIV medical care from a doctor, clinical officer, or nurse?	FACILITY IS TOO FAR AWAY . . . . . 01 I DON'T KNOW WHERE TO GET HIV MEDICAL CARE . . . . . 02 COST OF CARE . . . . . 03 COST OF TRANSPORT . . . . . 04 I DO NOT NEED IT / I FEEL HEALTHY / NOT SICK . . . . . 05 I FEAR PEOPLE WILL KNOW THAT I HAVE HIV IF I GO TO A CLINIC . . . . . 06 RELIGIOUS REASONS . . . . . 07 I'M TAKING TRADITIONAL MEDICINE . . . 08 DO NOT TRUST THE STAFF / QUALITY OF CARE . . . . . 09 OTHER _____ 96 (SPECIFY) DON'T KNOW . . . . . 98 REFUSED 99	→ 806
803	What month and year did you first see a doctor, clinical officer or nurse for HIV medical care? PROBE TO VERIFY DATE.	MONTH . . . . . ☐☐ DON'T KNOW . . . . . 98 REFUSED . . . . . 99 YEAR . . . . . ☐☐☐☐ DON'T KNOW . . . . . 9998 REFUSED 9999	
804	What month and year did you last see a doctor, clinical officer or nurse for HIV medical care?	MONTH . . . . . ☐☐ DON'T KNOW . . . . . 98 REFUSED . . . . . 99 YEAR . . . . . ☐☐☐☐ DON'T KNOW . . . . . 9998 REFUSED 9999	
805A	CHECK 804: WAS MONTH AND YEAR LESS THAN 7 MONTHS FROM DATE OF INTERVIEW OR DID RESPONDENT ANSWER DON'T KNOW?	YES . . . . . 1 NO 2	→ 806
805	What is the main reason for not seeing a doctor, clinical officer or nurse for HIV medical care for more than 6 months?	FACILITY IS TOO FAR AWAY . . . . . 01 DON'T KNOW WHERE TO GET HIV MEDICAL CARE . . . . . 02 COST OF CARE . . . . . 03 COST OF TRANSPORT . . . . . 04 DO NOT NEED IT / I FEEL HEALTHY / NOT SICK . . . . . 05 FEAR PEOPLE WILL KNOW THAT I HAVE HIV IF I GO TO A CLINIC . . . . . 06 RELIGIOUS REASONS . . . . . 07 TAKING TRADITIONAL MEDICINE . . . . . 08 DO NOT TRUST THE STAFF / QUALITY OF CARE . . . . . 09 OTHER _____ 96 (SPECIFY) DON'T KNOW . . . . . 98 REFUSED 99	

NO.	QUESTIONS AND FILTERS	CODING CATEGORIES	SKIP
806	Have you ever had a CD4 count test? The CD4 count tells you how sick you are with HIV and if you need to take ARVs or other HIV medications.	YES . . . . . 1 NO . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	→ 808A
807	What month and year were you last tested for your CD4 count?	MONTH . . . . . [ ][ ] DON'T KNOW . . . . . 98 REFUSED . . . . . 99 YEAR . . . . . [ ][ ][ ][ ] DON'T KNOW . . . . . 9998 REFUSED 9999	
808	Have you ever taken ARVs, that is, antiretroviral medications to treat HIV infection?	YES . . . . . 1 NO . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	→ 810 → END MODULE
809	What is the main reason you have never taken ARVs?	NOT ELIGIBLE FOR TREATMENT . . . . . 01 HEALTH CARE PROVIDER DID NOT PRESCRIBE . . . . . 02 HIV MEDICINES NOT AVAILABLE . . . . . 03 FEEL HEALTHY/NOT SICK . . . . . 04 COST OF MEDICATIONS . . . . . 05 COST OF TRANSPORT . . . . . 06 RELIGIOUS REASONS . . . . . 07 TAKING TRADITIONAL MEDICATIONS 08 OTHER _____ 96 (SPECIFY) DON'T KNOW . . . . . 98 REFUSED 99	→ END MODULE
810	What month and year did you first start taking ARVs? PROBE TO VERIFY DATE.	MONTH . . . . . [ ][ ] DON'T KNOW . . . . . 98 REFUSED . . . . . 99 YEAR . . . . . [ ][ ][ ][ ] DON'T KNOW . . . . . 9998 REFUSED 9999	
811	Are you currently taking ARVs, that is, antiretroviral medications? By currently, I mean that you may have missed some doses but you are still taking ARVs.	YES . . . . . 1 NO . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	→ 813 → END MODULE
812	Can you tell me the main reason why you are not currently taking ARVs?	TROUBLE TAKING IT EVERYDAY . . . . . 01 SIDE EFFECTS . . . . . 02 FACILITY TOO FAR . . . . . 03 COST OF MEDICATIONS . . . . . 04 COST OF TRANSPORT . . . . . 05 FEEL HEALTHY/NOT SICK . . . . . 06 FACILITY WAS OUT OF STOCK . . . . . 07 RELIGIOUS REASONS . . . . . 08 TAKING TRADITIONAL MEDICINES . . . 09 OTHER _____ 96 (SPECIFY) DON'T KNOW . . . . . 98 REFUSED 99	→ END MODULE
813	People sometimes forget to take all of their ARVs every day. In the last 30 days, how many days have you missed taking any of your ARV pills? CODE '00' IF NONE.	NUMBER OF DAYS . . . . . [ ][ ] DON'T KNOW . . . . . 98 REFUSED 99	

MODULE 9: TUBERCULOSIS AND OTHER HEALTH ISSUES

900 Now I will ask you about tuberculosis, or TB.

NO.	QUESTIONS AND FILTERS	CODING CATEGORIES	SKIP
901	Have you ever visited clinic for TB diagnosis or treatment?	YES . . . . . 1 NO . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	→ END MODULE
902	Have you ever been told by a doctor, clinical officer or nurse that you had TB?	YES . . . . . 1 NO . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	→ END MODULE
903	Were you ever treated for TB?	YES . . . . . 1 NO . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	→ END MODULE
904	Are you currently on treatment for TB?	YES . . . . . 1 NO . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	→ END MODULE → END MODULE
905	The last time you were treated for TB, did you complete at least 6 months of treatment?	YES . . . . . 1 NO . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	

MODULE 10: GENDER NORMS

1000 Now I would like to ask you some questions on attitudes and decision-making in your home.

NO.	QUESTIONS AND FILTERS	CODING CATEGORIES	SKIP
1001A	CHECK 203: IS THE RESPONDENT MARRIED OR LIVING TOGETHER WITH A [MAN/WOMAN] AS IF MARRIED?	YES . . . . . 1 NO 2	END →MODULE
1001	Who usually makes decisions about health care for yourself: you, your (spouse/partner), you and your (spouse/partner) together, or someone else?	SELF . . . . . 1 SPOUSE/PARTNER . . . . . 2 JOINTLY . . . . . 3 SOMEONE ELSE . . . . . 4 DON'T KNOW . . . . . 8 REFUSED 9	
1002	Who generally decides about how the money you receive/make is spent: you, your (spouse/partner), you and your (spouse/partner) together, or someone else?	SELF . . . . . 1 SPOUSE/PARTNER . . . . . 2 JOINTLY . . . . . 3 SOMEONE ELSE . . . . . 4 DON'T KNOW . . . . . 8 REFUSED 9	
1003A	CHECK Q.607: DID RESPONDENT EVER SELL SEX, ANSWER CODED '7'?	YES . . . . . 1 NO 2	END →MODULE
1003B	CHECK Q.7 FROM HOUSEHOLD ROSTER: IS RESPONDENT 18 YEARS OR OLDER?	YES . . . . . 1 NO 2	→ END MODULE
1003	You mentioned earlier that you have sold sex for money. Thank you for sharing your personal experiences with me. If you want to talk further about these experiences, I can refer you to a place that can provide you with help. FILL OUT REFERRAL FORM FOR CHILDREN IDENTIFIED AS TRAFFICKED MINORS. FILL OUT SUMMARY OF REFERRED TRAFFICKED MINORS. PROVIDE PARTICIPANT WITH LIST OF ORGANIZATIONS, IF NOT ALREADY GIVEN.		

APPENDIX G ADOLESCENT QUESTIONNAIRE

EARLY ADOLESCENT QUESTIONNAIRE (10-14 YEARS)

THIS QUESTIONNAIRE IS ADMINISTERED TO ELIGIBLE CHILDREN AGED BETWEEN 10-14 YEARS AFTER INFORMED PARENTAL/GUARDIAN CONSENT AND MINOR ASSENT.

100A	ENTER LINE NUMBER OF THE CHILD FROM THE HOUSEHOLD SCHEDULE:	☐☐
100B	ENTER NAME OF CHILD: _____ (CHILD'S NAME)	

MODULE 1: SOCIO-DEMOGRAPHIC CHARACTERISTICS

100C Now I will be asking you some general questions about yourself and education.

NO.	QUESTIONS AND FILTERS	CODING CATEGORIES	SKIP
101	CHECK THE HOUSEHOLD SCHEDULE: IS THE RESPONDENT MALE OR FEMALE?	MALE . . . . . 1 FEMALE 2	
102	How old were you at your last birthday?	AGE IN COMPLETED YEARS ☐☐ DON'T KNOW . . . . . 98 REFUSED 99	
103	Are you enrolled in school?	YES . . . . . 1 NO . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	→ 109
104	During the last school week, did you miss any school days for any reason?	YES . . . . . 1 NO . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	→ 106
105	Why did you miss school?	HAVE BEEN SICK . . . . . 01 DON'T FEEL SAFE TRAVELING TO SCHOOL . . . . . 02 DON'T FEEL SAFE WHILE IN SCHOOL 03 HAVE TO LOOK AFTER MY FAMILY 04 THERE'S NOT ENOUGH MONEY TO SEND ME TO SCHOOL . . . . . 05 SCHOOL IS TOO FAR AWAY . . . . . 06 HAVE TO WORK . . . . . 07 HAVE A CHILD OR I AM PREGNANT (GIRLS ONLY) . . . . . 08 MISSED TOO MUCH SCHOOL BECAUSE OF MY PERIOD (MENSTRUATION) (GIRLS ONLY) . 09 OTHER _____ (SPECIFY) 96 DON'T KNOW . . . . . 98 REFUSED 99	
106	What is the highest level of school you have attended?	PRIMARY . . . . . 01 JUNIOR SECONDARY . . . . . 02 SENIOR SECONDARY . . . . . 03 A-LEVEL . . . . . 04 KORANIC/RELIGIOUS ONLY (NO FORMAL EDUCATION) . . . . . 05 DON'T KNOW . . . . . 98 REFUSED 99	
107	What grade/form/year are you in now, at that level?	NONE . . . . . 00 YEARS ☐☐ DON'T KNOW . . . . . 98 REFUSED 99	

NO.	QUESTIONS AND FILTERS	CODING CATEGORIES	SKIP
108	What grade/form/year were you in last year?	NONE . . . . . 00 YEARS ☐☐ DON'T KNOW . . . . . 98 REFUSED 99	→ END MODULE
109	Why are you not enrolled in school?	I HAVE BEEN SICK . . . . . 01 I DON'T FEEL SAFE TRAVELING TO SCHOOL . . . . . 02 I DON'T FEEL SAFE WHILE IN SCHOOL IN SCHOOL . . . . . 03 I DON'T LIKE SCHOOL . . . . . 04 I HAVE TO LOOK AFTER MY FAMILY 05 THERE'S NOT ENOUGH MONEY TO SEND ME TO SCHOOL . . . . . 06 SCHOOL IS TOO FAR AWAY . . . . . 07 I HAVE TO WORK . . . . . 08 I HAVE A CHILD OR IS PREGNANT (GIRLS ONLY) . . . . . 09 MISSED TOO MUCH SCHOOL BECAUSE OF MY PERIOD (MENSTRUATION) (GIRLS ONLY) . 10 OTHER _____ 96 (SPECIFY) DON'T KNOW . . . . . 98 REFUSED 99	
110	Have you ever attended school?	YES . . . . . 1 NO . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	→ END MODULE
111	When was the last time you regularly attended school? Would you say it was less than a year ago or more than a year ago?	LESS THAN 1 YEAR AGO . . . . . 1 1 YEAR OR LONGER . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	
112a	What is the highest level of school you have attended?	PRIMARY . . . . . 01 JUNIOR SECONDARY . . . . . 02 SENIOR SECONDARY . . . . . 03 A-LEVEL . . . . . 04 KORANIC/RELIGIOUS ONLY (NO FORMAL EDUCTION) . . . . . 05 DON'T KNOW . . . . . 98 REFUSED 99	END →MODULE
112	What is the highest [CLASS/YEAR] you completed at that level?	NONE . . . . . 00 CLASS/YEAR ☐☐ DON'T KNOW . . . . . 98 REFUSED 99	

MODULE 2: PARENTAL SUPPORT

200 Now I will ask you about your parents. For each question, you can answer 'Always', 'Most of the time', 'Sometimes', 'Rarely', 'Never' or 'Don't know', or you can refuse to answer.

NO.	QUESTIONS AND FILTERS	CODING CATEGORIES	SKIP
201	Do your parents/guardians understand your problems and worries?	ALWAYS . . . . . 1 MOST OF THE TIME . . . . . 2 SOMETIMES . . . . . 3 RARELY . . . . . 4 NEVER . . . . . 5 DON'T KNOW . . . . . 8 REFUSED 9	
202	Do your parents/guardians really know what you were doing with your free time when you were not at school or work?	ALWAYS . . . . . 1 MOST OF THE TIME . . . . . 2 SOMETIMES . . . . . 3 RARELY . . . . . 4 NEVER . . . . . 5 DON'T KNOW . . . . . 8 REFUSED 9	

MODULE 3: ALCOHOL AND DRUGS

300 Now I will ask you some questions about alcohol and drugs or substances that you may have taken that were not given to you by doctor. Your answers will not be told to anyone, even your parents. For each question, you can always tell me you 'Don't know' or you can refuse to answer any question.

NO.	QUESTIONS AND FILTERS	CODING CATEGORIES	SKIP
301	Have you ever had alcohol? For example, wine, beer or liquor? SHOW GRAPHIC OF COMMON ALCOHOLIC BEVERAGES.	YES . . . . . 1 NO . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	→ 303
302	During the past 1 month, on how many days did you have at least one drink containing alcohol?	NUMBER OF DAYS . . . . . ☐☐ DON'T KNOW . . . . . 98 REFUSED 99	
303	Have you ever tried drugs such as Marijuana, also known as weed, or Benylene with Codeine, or Tramadol, or similar drugs?	YES . . . . . 1 NO . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	→ END MODULE
304	What drugs have you ever tried? ASK: Anything else?	MARIJUANA (WEED) . . . . . A BENYLENE WITH CODEINE . . . . . B TRAMADOl . . . . . C COCAINE . . . . . D HEROINE (CHARLY) . . . . . E SOLUTION . . . . . F CRACK . . . . . G INJECTABLE . . . . . H ROCHI . . . . . I OTHER _____ X (SPECIFY) DON'T KNOW . . . . . Y REFUSED . . . . . Z	

MODULE 4: CONDOMS

400 Now I would like to ask you some questions about condoms. Your answers will not be told to anyone, even your parents. For each of the questions, you can tell me you 'don't know' or you can refuse to answer any question.

NO.	QUESTIONS AND FILTERS	CODING CATEGORIES	SKIP
401	Do you know what a condom is?	YES . . . . . 1 NO . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	→ END MODULE
402	Do you know where to get a condom?	YES . . . . . 1 NO . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	→ 406
403	Where can a person go to get a condom? SELECT ALL THAT APPLY	CLINIC/HOSPITAL . . . . . A KIOSK/SHOP . . . . . B PHARMACY . . . . . C LOCAL FREE DISPENSERY . . . . . D FRIENDS/PEERS . . . . . E BOYFRIEND/GIRLFRIEND . . . . . F OTHER _____ X (SPECIFY) DON'T KNOW . . . . . Y REFUSED . . . . . Z	
404	If you wanted to, could you yourself get a condom?	YES . . . . . 1 NO . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	→ 406 → 406
405	Why is it not easy for you to get a condom? SELECT ALL THAT APPLY	TOO FAR . . . . . A COSTS TOO MUCH . . . . . B DO NOT WANT OTHERS TO KNOW . . . C OTHER _____ X (SPECIFY) DON'T KNOW . . . . . Y REFUSED . . . . . Z	
406	Have you ever seen a male condom demonstration? By a condom demonstration, I mean someone like a nurse, peer educator, or another trained adult showed how a male condom is correctly used.	YES . . . . . 1 NO . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	

MODULE 5: SEXUAL BEHAVIOR

500 The next questions ask about sexual behavior. There is no right or wrong answer. Your responses will not be linked to you in any way or shared with anyone, including your parents. For each question, you can always tell me you 'don't know' or you can refuse to answer any question.

PLEASE LOOK OUT FOR SIGNS OF DISTRESS IN CHILD WHEN ASKING THE FOLLOWING SEXUAL BEHAVIOR QUESTIONS. IF THE CHILD SEEMS DISTRESSED, ASK CHILD IF HE/SHE WANTS TO STOP THE INTERVIEW.

NO.	QUESTIONS AND FILTERS	CODING CATEGORIES	SKIP
501	Do you know what sex is?	YES . . . . . 1 NO . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	→ 600
501A	Have you ever had sex?	YES . . . . . 1 NO . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	→ 600
502	Have you ever had vaginal, anal or oral sex? Vaginal sex is when a penis enters a vagina. Anal sex is when a penis enters an anus. Oral sex is when a person puts his/her mouth on the penis or vagina of another person. SELECT ALL THAT APPLY.	VAGINAL . . . . . A ANAL . . . . . B ORAL . . . . . C DON'T KNOW . . . . . Y REFUSED . . . . . Z	→ 600
503	How old were you when you had sex for the first time?	AGE IN YEARS . . . . . ☐☐ DON'T KNOW . . . . . 98 REFUSED 99	
504	The first time you had sex, was it because you wanted to or because you were forced?	WANTED TO . . . . . 1 FORCED . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	→ 506 → 506
505	The first time you had sex, were you physically forced or were you pressured into having sex through harassment, threats or tricks?	PHYSICALLY FORCED . . . . . 1 PRESSURED . . . . . 2 DON'T KNOW . . . . . 8 REFUSED 9	→ 507

☐ English
☐ Hausa
☐ Igbo
☐ Yoruba

Nigeria AIDS Indicator and Impact Survey

Hello. My name is_____. I would like to invite you to take part in this survey about HIV in Nigeria. The Federal Ministry of Health and the National Agency for the Control of AIDS (NACA) are leading this survey. They are carrying out the survey with the United States Centers for Disease Control and Prevention (CDC).

Purpose of survey
This survey will help us know how many people in Nigeria have HIV and need health services. It will also tell us about people's risk for getting HIV.

We plan to invite about 98,207 households to take part in this survey. If you take part, you will help the Government of Nigeria make health services better in the country.

Survey Procedures

If you agree to take part in this survey, you will be invited to take part in two interviews: a household interview and a single person interview. In the household interview, we will ask you questions about persons living in your household and the things you have. This interview will last for about 30 minutes.

After the household interview, we will invite you and persons living in your household to take part in single person interviews. The single person interview will take about 40 minutes. We will also offer HIV testing after the interview. We may also offer Hepatitis B and Hepatitis C testing. We will ask each person to give permission to take part before joining the survey.

Potential Risks/Discomfort
Some of the questions may make you feel uncomfortable. You are free to skip a question and continue. The information you provided will be protected in a secure place. Access to the information will be minimized and limited to persons carrying out this survey.

Potential Benefits
You may or may not benefit by taking part in this study. If you take part, you and your household members will get free testing for HIV in your home. In addition, some people may also get free Hepatitis B or Hepatitis C testing. The answers you give will help Government to improve the health services of Nigerians and to develop more effective programs to fight HIV and other diseases.

Alternative to Taking Part
Your alternative is not to take part. If you choose not to take part, the services you or any member of your household receive will not be affected.

Costs to Person Taking Part in the Survey
It will not cost you anything to take part in this study other than your time.

Payment to Person Taking Part in the Survey
You will not receive any payment for taking part in this survey

Confidentiality and Access to Records
Efforts will be made to protect your household information and your answers to the interview questions. A number will be used instead of your name to identify the answers you give. Any answers included in the final report will not have your name or household on it. The information we collect from you will not be released outside of the study partners listed below unless there is an issue of safety.

{DO NOT READ ALOUD]

The following individuals and/or agencies may look at your household records to make sure that we are protecting your rights as someone who takes part in research:

- Staff members from the Nigerian National Health Research Ethics Committees (NHREC) and the Institutional Review Boards at the Centers for Disease Control and Prevention (CDC; Atlanta, USA)
- The United States Office of Human Research Protections and other government agencies that look at the safety of persons taking part in research to ensure we are protecting your child's rights as a person who takes part in this survey
- Study staff and study monitors

[READ FROM HERE]
Everyone using the survey information will work to keep your personal information secret. Your personal information will not be given out. If you have any questions or concerns about your household rights, or if you believe those rights were violated due to our negligence, you can contact the National Health Research Ethics Committee (NHREC) at

[INDICATE ADDRESS OF POC]

Address:

Tel: +234-803-586-8293
E-mail: info@nhrec.net

Refusal to Take Part and Right to Withdraw
Your taking part in this survey is voluntary. You do not have to take part in this survey. You are free to change your mind at any time and stop taking part. Refusal to take part or stopping to take part will not affect the health services you or any member of your household receive. If you decide not to take part or stop taking part, we will ask your permission to give us the reasons and the information you gave will not be included in analysis. If you have any questions about the survey, or feel that you have been harmed by taking part, you should contact the responsible investigator:

Removal from Survey
The person in charge of the survey can remove your household from the survey without your consent. We will notify you if this happens. You will have a chance to ask questions.

Do you want to ask me anything about the survey?

Consent Statement
I have read this form and/or someone has read it to me. I was encouraged to ask questions and given time to ask questions. Any questions that I had have been answered satisfactorily. I agree to take part in the household interview. I know that after choosing to be in the interview, I may withdraw at any time. My taking part is voluntary. I have been offered a copy of this consent form.
Do you agree to do the household interview? 'YES' means that you agree to do the interview. 'NO' means that you will NOT do the interview.

Appendix H2: Survey Consent for Individual Adult Interview and Blood Draw
(Age 18 – 64 years)

Nigeria AIDS Indicator and Impact Survey (NAIIS)

[IF PARTICIPANT HAS NOT BEEN THROUGH HOUSEHOLD CONSENT]

Interviewer reads: What language do you prefer for our discussion today?

☐ English
☐ Hausa
☐ Igbo
☐ Yoruba

Hello. My name is_____. I would like to invite you to take part in this survey about HIV in Nigeria. The Federal Ministry of Health and the National Agency for the Control of AIDS (NACA) are leading this survey. They are doing it with the United States Centers for Disease Control and Prevention (CDC). You are invited to take part in this survey because you are a member of a household. Taking part in this survey is voluntary.

Purpose of survey
This survey will help us know how many people in Nigeria have HIV and need health services. It will also tell us about people's risk for getting HIV.

We plan to invite about 137,289 members of households like you to take part in this survey. If you take part, you will help the Government of Nigeria make health services better in the country.

→ **GO TO SURVEY PROCEDURES**

[IF PARTICIPANT HAS BEEN THROUGH HOUSEHOLD CONSENT]

Hello, my name is_____.

Survey Procedures

If you take part in this survey, you will be invited to take part in a single person interview. We will ask you questions about yourself, your sexual and social life, and your awareness of HIV services. We will also ask for your permission to do a free HIV test on you. The interview will take about 40 minutes.

The information is collected on this tablet. The information is stored securely and can only be accessed by selected survey staff. The interview will take place in private here in your house or an area around your house.

After the interview, we will offer you HIV testing and may also offer Hepatitis B and Hepatitis C testing. We will also ask your permission to use your leftover blood later in the laboratory for future testing.

Blood draw and HIV testing procedures

If you agree to take the HIV, test trained laboratory personnel will take a small amount, about 14 mL or about one tablespoon of blood from your arm. If it is not possible to take blood from your arm, then we will try to take a few drops of blood from your finger. We will give you the HIV results today and offer you conselling services . The testing and counselling session will take about 40 minutes.

If we find HIV in your blood, you will get a Hepatitis B and C test here at home. If we dont find HIV in your blood, you may or may not be selected for Hepatitis B and C testing. We will also test your blood for CD4 cells here at home. The

number of CD4 cells shows how well your body can fight HIV infection and other diseases. We will also test the CD4 cells of some people who do not have HIV in their blood. We will also send your blood to a laboratory to find out your viral load, which is the amount of HIV in your blood. We will send your viral load results to a health facility in about 8-10 weeks from now. We will give you a referral form and information so that you can consult a nurse or doctor to learn more about your HIV, CD4 cells, viral load test results, and your health.

We will also do other additional tests related to HIV.
If we have test results that might help your care or treatment, we will contact you to tell you how you and your doctor or nurse may get these results.

Storage of specimens

We would also like your permission to keep your leftover blood sample for future research tests. These tests may be about HIV or other health issues important for the health of the Nigerian people, such as nutrition or immunization. This will help the Federal Ministry of Health improve the health of the people of Nigeria. This sample will be kept for at least five years and your information will be linked to the stored sample for the 5-year period and delinked afterward. We will attempt to tell you about any test results that are important to your health during the five-year period. Your leftover blood will not be sold or used for profit making. If you do not agree for us to keep your blood sample, we will destroy your blood sample after all tests for this survey are completed.

Potential Risks/Discomfort

Some of the questions may make you feel uncomfortable. You are free to skip a question and continue. The information you provided will be protected in a secure place.

The risks in drawing blood are very small. They include brief pain from the needle stick, bruising, lightheadedness, bleeding, and rarely, infection where the needle enters the skin. If you have any discomfort, bleeding or swelling at the site, please let us know.

You may learn that you are infected with HIV. Learning that you have HIV may cause some emotional discomfort. You will receive advice on how to cope with learning that you have HIV.

If you are selected for Hepatitis B and C testing, you will learn your Hepatitis B and C status. This may cause some emotional discomfort. You will receive advice on how to cope and where to go for treatment.

We will do everything we can to keep the information on your HIV status a secret. Access to the information will be minimized and limited to persons carrying out this survey.

Potential Benefits

You may or may not benefit by taking part in this study. The answers you give will help Government to improve the health services of Nigerians and to develop more effective programs to fight HIV and reduce its spread in the community. The main benefit for you to take part in this survey is the chance to learn more about your health today. If we do not find HIV in your blood, you will learn about what you can do to prevent becoming infected by HIV. If we find HIV in your blood, the benefit is that you will know your HIV status and where to go for life-saving treatment that is provided by the Federal Ministry of Health and the National Agency for the Control of AIDS (NACA) at no cost to you. If you already know that you are HIV positive and are on HIV treatment, the CD4 and viral load tests will help your nurse or doctor know how well your treatment is working.

Alternative to Taking Part in the Survey

Your alternative is not to take part. If you choose not to take part, the services you or any member of your household receive will not be affected.

Costs to Person Taking Part in the Survey

It will not cost you anything to take part in this study other than your time.

Payment to Person Taking Part in the Survey

You will not receive any payment for taking part in this survey

Confidentiality and Access to your Health Information
Efforts will be made to protect your personal information and your answers to the interview questions. A number will be used instead of your name to identify the answers you give. Any answers included in the final report will not have your name on it. The information we collect during the survey will not be released outside of the survey groups unless there is an issue of safety. Everyone using the survey information will work to keep your personal information confidential.

[INTERVIEWER: DO NOT READ ALOUD]

The following individuals and/or agencies may look at your research records to make sure that we are protecting your rights as someone taking part in research:

- Staff members from the Nigerian National Health Research Ethics Committees (NHREC) and the Institutional Review Boards at the Centers for Disease Control and Prevention (CDC; Atlanta, USA).
- The United States Office of Human Research Protections and other government agencies that look at the safety of persons taking part in research to ensure we are protecting your child's rights as a person who takes part in this survey.
- Study staff and study monitors.

[INTERVIEWER: READ FROM HERE]

Your permission to allow us to use and share your name and contact information with the groups above will expire two years after the end of the survey. If you want to leave the study, have any questions about the survey, or feel that you have been harmed by taking part, you should contact NHREC at:

[READ FROM HERE]

Refusal to Take Part and Right to Withdraw
Your taking part in this survey is voluntary. You are free to withdraw the permission to use your information and leftover blood at any time. Refusal to take part or withdrawal from the survey will not affect the health services you or any member of your household receive. You do not have to take part in giving your blood samples. Even after you agree to give the blood samples you are free to change your mind and stop taking part. You may agree to let us test your blood for HIV and CD4 counts and other HIV tests. If you do not want to give blood, please tell us. If you decide to stop taking part, there will be no adverse physical, social, economic, legal or psychological consequences for your decision to withdraw from the survey. If you have questions or concerns or complaints or if you need to report a medical injury related to the survey, please contact the responsible investigator:

Appendix H3: Parent/Guardian Permission for Children, ages 0-9 years

Nigeria AIDS Indicator and Impact Survey (NAIIS)

Now I would like to ask permission for your son/daughter to take part in the survey. Your child's taking part will help the Federal Ministry of Health and National Agency for the Control of AIDS (NACA) to plan well to fight HIV.

[IF PARENT/GUARDIAN HAS BEEN THROUGH CONSENT PROCESS FOR INTERVIEW/BLOOD DRAW]

Survey Procedures
If you give permission for your child to take part, we will go ahead as mentioned in your consent as follows:

- **[IF CHILD IS 2-9 YEARS OLD]** To do the HIV test in your home, a trained laboratory personnel will take about 6 mL or about 1 teaspoon of blood from your child's arm or a few drops of blood from your child's finger.
- **[IF CHILD IS <2 YEARS OLD]** A trained laboratory person will take a few drops (about 1 mL) from your child's finger or heel for the HIV test.

- We will discuss the results with you and your child, if you want to discuss them with him/her
- If your child has HIV, he/she will get a CD4 test and receive the results today.
- If your child is HIV positive, his/her blood will be sent to a laboratory to determine the viral load. The results will be returned to the clinic or hospital you would like in 8-10 weeks.
- We will give you a referral form so you and your child can consult with a doctor regarding his/her HIV test, and viral load results.
- We will ask for your permission to store your child's leftover blood for future research tests

[FOR CHILDREN ≤18 months ONLY]
The body makes antibodies to fight HIV. Antibodies from a mother with HIV can enter the baby's blood during pregnancy. The test we perform on your child today will let us know if your child has the antibodies that fight HIV. If we find the antibodies, it does not mean your child has the virus in his/her blood. It just shows that he/she has the antibodies to HIV and that the mother is positive. We will need to send your child's blood to a lab for a special test to know if he/she has the HIV virus. If you give us the name of a clinic or hospital, we can send the result there in about 8 to 10 weeks from now. If you give us your contact information, we will also contact you to tell you that the results have been sent to the clinic or hospital you chose. You will be able to talk to a doctor or nurse at the clininc or hospital about the test result. With your permission, the Federal Ministry of Health will use your child's leftover blood sample for future unspecified test results that may be important towards improving the health of Nigerian children

→ GO TO POTENTIAL STORAGE OF SPECIMENS
[IF PARENT/GUARDIAN HAS NOT BEEN THROUGH CONSENT PROCESS FOR INTERVIEW/BLOOD DRAW]

Interviewer reads: What language do you prefer for our discussion today?

☐ English
☐ Hausa
☐ Igbo
☐ Yoruba

Purpose of survey
This survey will help us know how many people in Nigeria have HIV and need health services. It will also tell us about people's risk for getting HIV.

We plan to invite about 31,000 children to take part in this survey. If you give permission for your child to take part, you will help the Government of Nigeria make health services better in the country.

Survey Procedures

[FOR CHILDREN 2-9 YEARS OLD] If you agree to allow your child to take part in the survey, a trained laboratory person will take a small amount or about 6 mL of blood or about 1 teaspoon from your child's arm to perform an HIV test here in your home. If it is not possible to take blood from your child's arm, then we will try to take a few drops of blood from your child's finger.

[FOR CHILDREN <2 YEAR OLD] If your child is less than 2 years, we will take a few drops (about 1 mL) from your child's finger or heel for the HIV test.

We will give you the results today and counsel you about the results and how to share the results with your child if you decide to share them with him/her. If you would like, we can discuss the test results together with your child. The entire testing and counselling session will take about 40 minutes.

If your child tests positive for HIV, We will test his/her blood for C4 cells here and also send his/her blood to a laboratory to test the amount viral load in his/her blood. CD4 cells are the part of your immune system that fights HIV infection and other diseases while viral load is the amount of HIV in the blood. We will also test the CD4 level of some children without HIV. If you provide us with the name of a health facility, we can send your child's viral load results there about 8 to 10 weeks from now.

We will give you a referral form and information so that you and your child can consult with a doctor or nurse to learn more about his/her HIV test, CD4 count, and viral load. If we have test results that might guide your child's care or treatment, we will contact you to tell you how you and your child's doctor or nurse may get these results.

[For children ages 0-<18 months only]

The body makes antibodies to fight HIV. Antibodies from a mother with HIV can enter the baby's blood during pregnancy. The test we perform on your child today will let us know if your child has antibodies to HIV and if the mother is HIV positive. If we find the antibodies, it does not mean your child has the HIV virus in his/her blood. It just tells us that he/she has antibodies to HIV. We will need to send your child's blood sample to a lab for a special test to know if he/she truly has the HIV virus. If you give us the name of a clinic or hospital you would like to send the result to, we can send the result there in about 8 - 10 weeks from now. If you give us your contact information, we will also contact you to tell you that the results have been sent to the clinic or hospital,. You will be able to talk to a doctor or nurse at the clinic or hospital about the test result.

Storage of specimens

We would like to ask for your permission to store your child's leftover blood sample for future research tests. These tests may be about HIV or other health issues important for the health of about 170 million Nigerians, such as nutrition or immunization. This sample will be stored for at least five years, but your child's name will be linked to the sample for only five years. We will attempt to tell you about any test results during the five-year period that are important for your child's health. Your child's leftover blood sample will not be sold or used for profit making. If you do not agree to long-term storage of your child's blood samples, we will destroy your child's blood samples after all tests for this survey are completed.

Potential Risks

The risks to being in the survey and drawing blood are small. They include brief pain from the needle stick, bruising, lightheadedness, bleeding, and rarely, infection where the needle enters the skin. We will do everything we can to minimize these risks and keep your child's information private.

Potential Benefits

The main benefit for your child to be in the survey is the chance to learn more about his/her health today. Some children who take part will have HIV virus found in their blood. If this happens to your child, the benefit is that you will learn his/her HIV and will learn where to take your child for life-saving treatment for HIV that is provided by the Federal Ministry of Health at no cost to you. If you already know that your child has HIV and he/she is taking treatment, the CD4 and viral load tests can help your child's doctor or nurse to find out how well the treatment is working. Your child's taking part in this research could help us learn more about children and HIV in Nigeria and how HIV prevention and treatment programs are working.

Alternative to Taking Part in the Survey

Your alternative is not to let your child take part in the survey. If you choose not to let him/her takes part, the services you and your child receive will not be affected in any way.

Costs to Person Taking Part in the Survey

There is no cost to you for your child being in the survey. All the tests are given at no cost to you.

Payment to Person Taking Part in the Survey

You should also know that you and your child will not be paid for taking part in the survey.

Confidentiality and Access to Your Health Information

We will do everything we can to keep your child's taking part in the survey private. The information we collect from your child will be identified by a number and not by your name or your child's name. Your name and your child's name will not appear when we share survey results. The information we collect from your child will not be released outside of the survey groups listed below unless there is an issue of safety.

[INTERVIEWER: DO NOT READ ALOUD]

The following individuals and/or agencies will be able to look at your child's research records to help oversee the conduct of this survey:

- Staff members from the Institutional Review Boards or Ethics Committees overseeing the conduct of this survey to ensure that we are protecting your child's rights as he/she takes part in the survey. These include the National Health Research Ethics Committee (NHREC) and the Institutional Review Boards at the Centers for Disease Control and Prevention (CDC; Atlanta, USA),

- The United States Office of Human Research Protections and other government agencies that oversee the safety of human subjects to ensure we are protecting your child's rights as he/she takes part in this survey

- Study staff and study monitors

[INTERVIEWER: READ FROM HERE]

Your permission to allow us to use and share your child's name and contact information with the groups above will expire two years after the end of the survey. If you want your child to leave the study, have any questions about the survey, or feel that your child has been harmed by taking part, you should contact NHREC at:

Garki, Abuja
P.M.B. 083 Garki Abuja
Tel: +234-803-586-8293
E-mail: info@nhrec.net

Refusal to Take Part and Right to Withdraw

It is your decision whether you will allow your child to join the survey. Your child may stop taking part at any time. If your child does not take part, it will not affect your child's health care in any way. Even after you agree to give your child's blood samples, you are free to change your mind and stop taking part. You may agree to let us test your child's blood for HIV and CD4 counts and other HIV testing and not agree to have his/her blood be kept for future research tests. If you do not want to give your child's blood, please tell us. If you decide to stop taking part, we will request you to complete a refusal/withdrawal form and the samples you gave will not be included in analysis. Your permission to allow us to use and share your child's information with the groups above will expire two years after the end of the survey. If you want to leave the survey, or have the leftover specimen destroyed, have any questions about the survey, or feel that you have been harmed by taking part, you should contact the responsible investigator: …

Do you want to ask me anything about your child's taking part in the survey?

Consent Statement
I have read this form, and/or someone has read it to me. I was encouraged to ask questions and given time to ask questions. Any questions I had have been answered satisfactorily. I agree for my child to take part in this survey. I know that after allowing my child to take part, I may change my mind and withdraw him/her from taking part in this survey at any time. I have been offered a copy of this consent form.

1. Do you agree that your child give blood for HIV testing and related testing? 'YES' means that you give your permission to have the nurse collect a sample of your child's blood for HIV testing and related testing. 'NO' means that your child will NOT give blood for HIV testing and related testing.

   _____Yes _____No
   (if "Yes" proceed to the next question)

2. Do you agree to have your child's leftover blood stored for future research? 'YES' means that you give permission for your child's leftover blood samples to be stored for future research. 'NO' means that your child's blood samples will NOT be stored for future research.

   _____Yes _____No

3. Do you agree to be contacted should these future studies have clinically actionable results that are related to your child's health? 'YES' means that you agree to be contacted. 'NO' means that you don't agree to be contacted.

   _____Yes _____No

Appendix H4: Parent/Guardian Permission for Child Interview and Blood Draw [ages 10-17 years]

Nigeria AIDS Indicator and Impact Survey (NAIIS)

Now I would like to ask you to give us permission to invite your son/daughter to take part in the survey. Your child's taking part will help the Federal Ministry of Health and the National Agency for the Control of AIDS make HIV services better.

[IF PARENT/GUARDIAN HAS BEEN THROUGH CONSENT PROCESS FOR INTERVIEW/BLOOD DRAW]

Survey Procedures

If you and your child agree, the following will happen, as described in your own consent:

- We will ask questions on HIV and your child's behaviors (about 40 minutes) in private. Your child's answers will not be shared with you.
- To do the HIV test in your home.

[IF 10-14 YEARS]:

- A trained lab technician will take about 6 mL (about 1 teaspoon) of blood from your child's arm or a few drops of blood from your child's finger.
- We will discuss the results with you. We can discuss the results with you and your child together, if you so choose.
- If your child is HIV positive, we will test his/her blood for CD4 cells count here at home. We will send his/her blood to a laboratory to determine the viral load. The results will be returned to the clinic or hospital you would like in 8 – 10 weeks.We will give you a referral form so you and your child can consult with a doctor regarding his/her HIV test, CD4 count and viral load results
- With your permission, the Federal Ministry of Health will use your child's leftover blood sample for future unspecified test results that may be important towards improving health of Nigerian children.

[IF 15-17 YEARS]:

- A trained lab technician will take about 14 mL (about one tablespoon) of blood from your child's arm or a few drops of blood from your child's finger.
- We will discuss the results with you. We can discuss the results with you and your child together, if you so choose.
- If your child is HIV positive, we will test his/her blood for CD4 cells count here at home. We will send his/her blood to a laboratory to determine the viral load. The results will be returned to the clinic or hospital you would like in 10-12 weeks. We will give you a referral form so you and your child can consult with a doctor regarding his/her HIV test, CD4 count and viral load results
- If your child is HIV positive, he/she will also get a Hepatitis B and C test. If you child tests positive for Hepatitis B or C, we will give you a referral form so you and your child can consult with a doctor regarding his/her test results.
- If your child is HIV negative, he/she may be randomly selected for CD4 testing and for Hepatitis B and C testing. If we have test results that might guide your child's care or treatment, we will give you a referral form so you and your child can consult with a doctor regarding his/her test results.
- With your permission, the Federal Ministry of Health will use your child's leftover blood sample for future unspecified test results that may be important towards improving health of Nigerian children.

[IF PARENT/GUARDIAN HAS NOT BEEN THROUGH CONSENT PROCESS FOR INTERVIEW/BLOOD DRAW]

Interviewer reads: What language do you prefer for our discussion today?

☐ English
☐ Hausa
☐ Igbo
☐ Yoruba

Purpose of survey
This survey will help us know how many people in Nigeria have HIV and need health services. It will also tell us about people's risk for getting HIV.

We plan to invite about 31,000 children to take part in this survey. If you give permission for your child to take part, you will help the Government of Nigeria make health services better in the country.

Survey Procedures
If you agree to allow us to invite your child to take part in the survey, we will ask your child to do an interview with us in private to learn what your child knows about HIV and about your child's behaviors that may put him or her at risk for HIV. The interview will take about 40 minutes. We will not share your child's answers to the interview questions with you. The interview will take place in private here in your house or an area around your house.

[IF 10-14 YEARS]: If you and your child agree, a trained laboratory person will take a small amount or about 6 mL (about 1 teaspoon) of blood from your child's arm to perform an HIV test here in your home. If it is not possible to take blood from your child's arm, then we will try to take a few drops of blood from your child's finger. We will give you the results today and discuss with you how to share the results with your child if you decide to share them with him/her. If you would like, we can discuss the test results together with your child. The entire testing and advice session will take about 40 minutes.

If your child tests positive for HIV, we will test his/her blood for CD4 cells count here at home and send his/her blood to a laboratory to test the viral load in his/her blood. CD4 cells are the part of your immune system that fights HIV infection and other diseases while viral load is the amount of HIV in the blood. We will also test the CD4 level of some children without HIV. If you provide us with the name of a health facility, we can send your child's viral load results there about 8 to 10 weeks from now. We will give you a referral form and information so that you and your child can consult with a doctor or nurse to learn more about his/her HIV test, CD4 count, viral load, and health.

We will also do other additional tests related to HIV. If we have test results that might help your child's care or treatment, we will contact you to tell you how you and your child's doctor or nurse may get these results.

With your permission, the Federal Ministry of Health will use your child's leftover blood sample for future unspecified test results that may be important towards improving health of Nigerian children.

[IF 15-17 YEARS]: If you and your child agree, a trained laboratory personnel will take a small amount or about 14 mL (about one tablespoon) of blood from your child's arm to perform an HIV test here in your home. If it is not possible to take blood from your child's arm, then we will try to take a few drops of blood from your child's finger. We will give you the results today and discuss with you how to share the results with your child if you decide to share them with him/her. If you would like, we can discuss the test results together with your child. The entire testing and advice session will take about 40 minutes.

If your child tests positive for HIV, we will test his/her blood for CD4 cells count here at home and send his/her blood to a laboratory to test the viral load in his/her blood. CD4 cells are the part of your immune system that fights HIV infection and other diseases while viral load is the amount of HIV in the blood. We will also test the CD4 level of some children without HIV. If you provide us with the name of a health facility, we can send your child's viral load results there about 8 to 10 weeks from now. We will give you a referral form and information so that you and your child can consult with a doctor or nurse to learn more about his/her HIV test, CD4 count, viral load, and health.

If your child tests positive for HIV, we will test his/her blood for Hepatitis B and C. If your child test positive for Hepatitis B and/or C, we will give you a referral form and information so that you and your child can consult with a

doctor or nurse to learn more about his/her Hepatitis and health.

If your child is HIV negative, he/she may be randomly selected for CD4 testing and for Hepatitis B and C testing. If we have test results that might guide your child's care or treatment, we will give you a referral form so you and your child can consult with a doctor regarding his/her test results.

We will also do other additional tests related to HIV. If we have test results that might help your child's care or treatment, we will contact you to tell you how you and your child's doctor or nurse may get these results.

With your permission, the Federal Ministry of Health will use your child's leftover blood sample for future unspecified test results that may be important towards improving health of Nigerian children.

Storage of specimens
We would like to ask for your permission to store your child's leftover blood for future tests. These tests may be about HIV or other health issues important for the health of Nigerian people such as nutrition or immunization. This sample can be stored for at least five years, but your child's name will be linked to the sample for five years. We will attempt to tell you about any test results during the five-year period that are important for your child's health. Your child's leftover blood will not be sold or used for profit making. If you do not agree to long-term storage of your child's blood samples, we will destroy your child's blood samples after all tests for this survey are completed.

Potential Risks
Your child may feel uncomfortable answering some of the questions. Your child does not need to answer any question(s) if they feel the question(s) makes them feel uncomfortable.

The risks to being in the survey and drawing blood are small. They include brief pain from the needle stick, bruising, lightheadedness, bleeding, and rarely, infection where the needle enters the skin. We will do everything we can to minimize these risks and keep your child's information private.

Potential Benefits
There may be no direct benefit to your child for taking part in the interview. The main benefit for your child is the chance to learn more about his/her health today. Some children who take part will be found to have HIV. If this happens to your child, the benefit is that you will learn his/her HIV, status and will learn where to take your child for free HIV treatment that is given by the Federal Ministry of Health. If you already know that your child has HIV and he/she is taking drugs for HIV, the CD4 and viral load tests can help your child's doctor or nurse to know how well the drugs are working. Your child's taking part in this research could help us learn more about children and HIV in Nigeria and how HIV prevention and treatment programs are working.

Alternative to Taking Part in the Survey
Your alternative is not to let your child take part in this survey. If you choose not to let him/her take part, the services you all receive will not be affected in any way.

Costs to Person Taking Part in the Survey
There is no cost to you for your child being in the survey.

Payment to Person Taking Part in the Survey
You should also know that you and your child will not be paid for your child to be in the survey.

Confidentiality and Access to Your Child's Health Information
We will do everything we can to keep information about your child's secret. The information we collect from your child will be identified by a number and not by your name or your child's name. Your name and your child's name will not appear when we share survey results. The information we collect from your child will not be released outside of the study partners listed below unless there is an issue of safety.

[INTERVIEWER: DO NOT READ ALOUD]

The following individuals and/or agencies may look at your child's research records to make sure that we are protecting your child's rights as he/she takes part in the survey:

- Staff members from the Nigerian National Health Research Ethics Committees (NHREC) and the Institutional Review Boards at the Centers for Disease Control and Prevention (CDC; Atlanta, USA)
- The United States Office of Human Research Protections and other government agencies that look at the safety of persons taking part in research to ensure we are protecting your child's rights as a person who takes part in this survey
- Study staff and study monitors

[INTERVIEWER: READ FROM HERE]

Your permission to allow us to use and share your child's name and contact information with the groups above will expire two years after the end of the survey. ☐ Yoruba

Nigeria AIDS Indicator and Impact Survey (NAIIS)

Hello. My name is_____. I would like to invite you to take part in a survey of Nigerians to learn more about HIV in the country. The Federal Ministry of Health and the National Agency for the Control of AIDS (NACA) are leading this survey. They are doing it with the United States Centers for Disease Control and Prevention (CDC). You are invited to take part in this survey because you are a member of a household. Taking part in this survey is voluntary.

Purpose of the survey
This survey will help us know how many people in Nigeria have HIV and need health services. It will also tell us about people's risk for getting HIV.

We plan to ask over 31,000 young persons some of them aged 15-17 years like you and live in a household to join this survey. A survey is a way to learn new information about something by asking questions and testing many people.

We would like to invite you to join this survey. Your parent/guardian said it was okay for us to ask you to join the survey. This form might have some words in it that are not familiar to you. Please ask us to explain anything that you do not understand.

Survey Procedures

If you take part in this survey, you will be invited to take part in a single person interview. We will ask you questions about yourself, your sexual and social life and your awareness of HIV services. We will also ask for your permission to do a free HIV test on you. The interview will take about 40 minutes.

The information is collected on this tablet. The information is stored securely and can only be accessed by selected survey staff. The interview will take place in private here in your house or an area around your house.

After the interview, we will offer you HIV testing and may also offer Hepatitis B and Hepatitis C testing. We will also ask your permission to use you blood later in the laboratory for future testing.

Blood draw and HIV testing procedures

If you agree to take the HIV test, trained laboratory personnel will take a small amount, about 14 mL or one tablespoon of blood from your arm. If it is not possible to take blood from your arm, then we will try to take a few drops of blood from your finger. We will give your parent or guardian the HIV results today and offer counselling services. The testing and counselling session will take about 40 minutes.

If we find HIV in your blood, you will get a Hepatitis B and C test here at home. We will also test your blood for CD4 cells t here at home. CD4 cells shows how well your body can fight HIV infection and other diseases. We will also test the CD4 cells of some people who do not have HIV in their blood. We will also send your blood to a laboratory to find out your viral load which is the amount of HIV in your blood. We will send your viral load results to a health facility in about 8-10 weeks from now. We will give your parent or guardian a referral form and information so that you and

your parent or guardian can consult a nurse or doctor to learn more about your HIV, CD4 cells, viral load test results, and your health.

We will also do other additional tests related to HIV. Some HIV-negative people may also be randomly selected for Hepatitis B and Hepatitis C testing.

If we have test results that might help your care or treatment, we will contact your parent or guardian to tell you how you and your doctor or nurse may get these results.

Storage of specimens
We would also like your permission to keep your leftover blood sample for future research tests. These tests may be about HIV or other health issues important for the health of Nigerian people, such as nutrition or immunization. This will help the Federal Ministry of Health improve the health of the people of Nigeria. This sample can be kept for at least five years and your name will be linked to the sample for the five years. We will attempt to tell you about any test results during the five-year period that are important to your health. Your leftover blood will not be sold or used for profit making. If you do not agree for us to keep your blood sample, we will destroy your blood sample after all tests for this survey are completed.

Potential Risks/Discomfort
Some of the questions may make you feel uncomfortable. You are free to skip a question and continue. The information you provided will be protected in a secure place.

The risks in drawing blood are very small. They include brief pain from the needle stick, bruising, lightheadedness, bleeding, and rarely, infection where the needle enters the skin. If you have any discomfort, bleeding or swelling at the site, please let us know.

You may learn that you are infected with HIV. Learning that you have HIV may cause some emotional discomfort. You will receive advice on how to cope with learning that you have HIV.

If you are selected for Hepatitis B and C testing, you will learn your Hepatitis B and C status. This may cause some emotional discomfort. You will receive advice on how to cope and where to go for treatment.

We will do everything we can to keep the information on your HIV status a secret. Access to the information will be minimized and limited to persons carrying out this survey.

Potential Benefits
You may or may not benefit by taking part in this study. The answers you give will help Government to improve the health services of Nigerians and to develop more effective programs to fight HIV and reduce its spread in the community. The main benefit for you to take part in this survey is the chance to learn more about your health today. If we do not find HIV in your blood, you will learn about what you can do to stay away from HIV. If we find HIV in your blood the benefit is that you will know your HIV status and where to go for free life-saving treatment that is provided by the Federal Ministry of Health and the National Agency for the Control of AIDS (NACA). If you already know that you are HIV-positive and are on HIV treatment, the CD4 and viral load tests will help your nurse or doctor know how well your treatment is working.

Alternative to Taking Part in the Survey
Your alternative is to not take part. If you choose not to take part, the services you or any member of your household receive will not be affected.

Costs to Person Taking Part in the Survey
There is no cost to you or to your parent/guardian if you take part in this survey.

Payment to Person Taking Part in the Survey
You should also know that you and your parent/guardian will not be paid to be in the survey.

Confidentiality and Access to Your Health Information
What we talk about will be kept secret and will not be shown to anyone outside of the survey team. Your answers to the questions will be identified only by a number. Your name will not appear when we share survey results. You can choose to tell your parent/guardian about the interview. However, we will not tell your answers to your parent or guardian. The information we collect during the survey will not be released outside of the survey groups listed below unless there is an issue of safety.

[INTERVIEWER: DO NOT READ ALOUD]

The following persons and/or agencies may look at your research records to make sure that we are protecting your rights as he/she takes part in the survey:

- Staff members from the Nigerian National Health Research Ethics Committees (NHREC) and the Institutional Review Boards at the Centers for Disease Control and Prevention (CDC; Atlanta, USA).
- The United States Office of Human Research Protections and other government agencies that look at the safety of persons taking part in research to ensure we are protecting your rights as a person who takes part in this survey.
- Study staff and study monitors.

[INTERVIEWER: READ FROM HERE]

If you want to leave the study, have any questions about the survey, or feel that you have been harmed by taking part, you should contact the NHREC at:

Nigeria AIDS Indicator and Impact Survey (NAIIS)

Hello. My name is_____. I would like to invite you to take part in a survey of Nigerians to learn more about HIV in the country. The Federal Ministry of Health and the National Agency for the Control of AIDS (NACA) are leading this survey. They are doing it with the United States Centers for Disease Control and Prevention (CDC). You are invited to take part in this survey because you are a member of a household. Taking part in this survey is voluntary.

Purpose of the survey
This survey will help us know how many people in Nigeria have HIV and need health services. It will also tell us about people's risk for getting HIV.

We plan to ask over 31,000 young persons, some of them aged 10-14 years like you and live in a household, to join this survey. A survey is a way to learn new information about something by asking questions and testing many people.

We would like to invite you to join this survey. Your parent/guardian said it was okay for us to ask you to join the survey. This form might have some words in it that are not familiar to you. Please ask us to explain anything that you do not understand.

Survey Procedures
If you take part in this survey, you will be invited to take part in a single person interview. We will ask you questions about yourself, your sexual and social life and your awareness of HIV. We will also ask for your permission to do free HIV test on you. The interview will take about 40 minutes.

The information is collected on this tablet. The information is stored securely and can only be accessed by selected survey staff. The interview will take place in private here in your house or an area around your house.

Blood draw and HIV testing procedures
If you agree to take the HIV test, trained laboratory personnel will take a small amount, about 6 mL or 1 teaspoons of blood from your arm. If it is not possible to take blood from your arm, then we will try to take a few drops of blood from your finger. We will give your parent or guardian the HIV results today and offer counselling services. The testing and counselling session will take about 40 minutes.

If we find HIV in your blood, will also test your blood for CD4 cells count here at home. CD4 cells shows how well your body can fight HIV infection and other diseases. We will also test the CD4 of some people who do not have HIV in their blood. We will also send your blood to a laboratory to find out your viral load which is the amount of HIV in your blood. We will send your viral load results to a health facility in about 10-12 weeks from now. We will give your parent or guradian a referral form and information so that they can consult a nurse or doctor to learn more about your HIV, CD4 cells, viral load test results, and your health.

If we have test results that might help your care or treatment, we will contact your parent or guardian to tell them how to get the results.

Storage of specimens
We would also like your permission to keep your leftover blood sample for future research tests. These tests may be about HIV or other health issues important for the health of Nigerian people, such as nutrition or immunization. This will help the Ministry of Health improve the health of the people of Nigeria. This sample can be kept for at least five years and your name will be linked to the sample for the five years. We will attempt to tell you about any test results during the five-year period that are important to your health. Your leftover blood will not be sold or used for profit making. If you do not agree for us to keep your blood sample, we will destroy your blood sample after all tests for this survey are completed.

Potential Risks and benefits
Some of the questions may make you feel uncomfortable. You are free to skip a question and continue. The information you provided will be protected in a secure place.

The risks in drawing blood are very small. They include brief pain from the needle stick, bruising, lightheadedness, bleeding, and rarely, infection where the needle enters the skin. If you have any discomfort, bleeding or swelling at the site, please let us know.

We will do everything we can to keep the information on your HIV status a secret. Access to the information will be minimized and limited to persons carrying out this survey.

Alternative to Taking Part in the Survey
Your alternative is to not take part. If you choose not to take part, the services you or any member of your household receive will not be affected.

Costs to Person Taking Part in the Survey
There is no cost to you or to your parent/guardian if you take part in this survey.

Payment to Person Taking Part in the Survey
You should also know that you and your parent/guardian would not be paid to be in the survey.

Confidentiality and Access to Your Health Information
What we talk about will be kept secret and will not be shown to anyone outside of the survey team. Your answers to the questions will be identified only by a number. Your name will not appear when we share survey results. You can choose to tell your parent/guardian about the interview. However, we will not tell your answers to your parent or guardian. The information we collect during the survey will not be released outside of the survey groups listed below unless there is an issue of safety.

[INTERVIEWER: DO NOT READ ALOUD]

The following persons and/or agencies may look at your research records to make sure that we are protecting your rights as he/she takes part in the survey:

- Staff members from the Nigerian National Health Research Ethics Committees (NHREC) and the Institutional Review Boards at the Centers for Disease Control and Prevention (CDC; Atlanta, USA).
- The U.S. Office of Human Research Protections and other government agencies that look at the safety of persons taking part in research to ensure we are protecting your rights as a person who takes part in this survey.
- Study staff and study monitors.

[INTERVIEWER: READ FROM HERE]

If you want to leave the study, have any questions about the survey, or feel that you have been harmed by taking part, you should contact the NHREC at:

Refusal to Take Part and Right to Withdraw
You do not have to take part in the survey. Even If you choose to join the survey, you may change your mind at any time and stop taking part. If you decide not to take part, it will not affect your healthcare in any way. Your permission to allow us to use and share your information with the groups above will expire two years after the end of the survey. If you want to leave the survey, have any questions about the survey, or feel that you have been harmed by taking part, you should contact the responsible investigator:

Nigeria AIDS Indicator and Impact Survey (NAIIS)

Purpose of consent
Your child had a positive HIV test today. We have provided you with a referral form that you and your child can take to a health clinic to seek HIV treatment and care. We would like to help you and your child in accessing the health care that your child needs. If you agree, we will provide your contact information and your child's HIV results to health workers or counselors from a trained social service organization. This counselor will contact you to talk to you and your child about HIV and help you and your child go for HIV care. Anyone who is provided with you and your child's details will be experienced in providing support to people living with HIV and will be trained in maintaining confidentiality.

What do you have to do if you agree to take part?
If you agree for your child's information to be shared, and to be contacted, we will provide your name, phone number (if you provided it to us) and your address to those counselors to provide you with support. The counselor can contact you by short message service (SMS), by phone, or in person.

What are the potential risks?
As with all surveys, there is a chance that confidentiality could be compromised. We are doing everything we can to minimize this risk.

What are the potential benefits?
A counselor will assist you in accessing the health care needed by your child.

What about confidentiality?
Your child's HIV test results and your child's contact information will not be shared with any other parties aside from what was specified in the other consent forms, and with this support organization. They will also do their utmost to maintain your child's confidentiality. However, we cannot guarantee complete confidentiality.

Who should you contact if you have questions?
If you change your mind or have any questions or feel that your child has been harmed by taking part, you should contact the Investigator listed below:

Dr. Evelyn Ngige
Address: Federal Ministry of Health
Phone: +234-803-303-8090
Email: nkadingige@yahoo.com

Dr. Ibrahim Dalhatu
Address: US CDC Nigeria Office
Phone: +234-806-051-0525
Email: idalhatu@cdc.gov

If you decide your child should leave the study, no more information will be collected from you. However, we will not be able to take back the information that has already been collected and shared.

If you have any questions about your child's rights as a person in this survey, you can contact:

National Health Research Ethics Committee of Nigeria
Address: Federal Ministry of Health, Federal Secretariat Complex, Abuja
Tel: +234-803-586-8293

Do you want to ask me anything about the survey?

Consent Statement
Any questions that I had were answered satisfactorily. I have been offered a copy of this consent form.

1. Do you agree to allow us to share your contact information with the State Ministry of Health or a partner that Ministry of Health works with, who may contact you to assist and support you and your child in seeking HIV care? 'YES' means that you agree for your information to be shared. 'NO' means that you do not agree for your information to be shared.

   _____Yes _____No

2. If yes, do you agree to be contacted by?

Nigeria AIDS Indicator and Impact Survey (NAIIS)

Purpose of consent
You had a positive HIV and/or Hepatitis B or Hepatitis C test today. We have provided you with a referral form to bring to a health clinic and seek HIV treatment and/or Hepatitis B or Hepatitis C care. We would like to help you in accessing the health care that you need. If you agree, we may be able to provide your contact information and HIV and or Hepatitis B or C test results to healthcare workers from the State Ministry of Health (SMOH) or to a partner that the SMOH work with. This healthcare worker will contact you to talk to you about HIV and or Hepatitis B or C and help you go for appropriate treatment and care. Anyone who is provided with your details will be experienced in providing support to people living with HIV and or Hepatitis B or Hepatitis C infection and will be trained in maintaining confidentiality.

What do you have to do if you agree to take part?
If you agree for your information to be shared and to be contacted, we will provide your name, phone number (if you provided it to us) and your address to those health care providers to provide you with support. The health care worker can contact you by short message service (SMS), by phone or in person based on your preference.

What about confidentiality?
Your HIV and or Hepatitis B or C test results and your contact information will not be shared with any other parties aside from what was specified in the other consent forms, and with this support organization. They will also do their utmost to maintain your confidentiality. However, we cannot guarantee complete confidentiality.

What are the potential risks?
As with all surveys, there is a chance that confidentiality could be compromised. We are doing everything we can to minimize this risk.

What are the potential benefits?
A healthcare worker will assist you in accessing the health care that you need.

Who should you contact if you have questions?
If you change your mind or have any questions or feel that you have been harmed by taking part, you should contact any of the Principal Investigators listed below:

Dr. Evelyn Ngige
Address: Federal Ministry of Health
Phone: +234-803-303-8090
Email: nkadingige@yahoo.com
